EdSurvey-package   *Analysis of NCES Education Survey and Assessment Data*

Description

The `EdSurvey` package uses appropriate methods for analyzing NCES datasets with a small memory footprint. Existing system control files, included with the data, are used to read in and format the data for further processing.

Details

To get started using `EdSurvey`, see the vignettes for tutorials and the statistical methodologies. Use `vignette("introduction", package="EdSurvey")` to see the vignettes.

The package provides functions called readNAEP, readCivEDICCS, readICILS, readPIAAC, readPIRLS, read_ePIRLS, readPISA, readTALIS, readTIMSS, readTIMSSAdv, and readECLS_K2011 to read in NCES datasets. The functions achievementLevels, cor.sdf, edsurveyTable, summary2, lm.sdf, logit.sdf, mixed.sdf, rq.sdf, percentile, and gap can then be used to analyze data. For advanced users, getData extracts the data of interest as a data frame for further processing.

---

achievementLevels   *Achievement Levels*

Description

Returns achievement levels using weights and variance estimates appropriate for the edsurvey.data.frame.

Usage

```
achievementLevels(
  achievementVars = NULL,
  aggregateBy = NULL,
  data,
  cutpoints = NULL,
  returnDiscrete = TRUE,
  returnCumulative = FALSE,
  weightVar = NULL,
  jrrIMax = 1,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  returnNumberOfPSU = FALSE,
  returnVarEstInputs = FALSE,
  omittedLevels = deprecated()
)
```

Arguments

achievementVars

character vector indicating variables to be included in the achievement levels table, potentially with a subject scale or subscale. When the subject scale or subscale is omitted, the default subject scale or subscale is used. You can find the default composite scale and all subscales using the function showPlausibleValues.

aggregateBy   character vector specifying variables by which to aggregate achievement levels. The percentage column sums up to 100 for all levels of all variables specified here. When set to the default of NULL, the percentage column sums up to 100 for all levels of all variables specified in achievementVars.

data   an edsurvey.data.frame

cutpoints   numeric vector indicating cutpoints. Set to standard NAEP cutpoints for Basic, Proficient, and Advanced by default.

returnDiscrete   logical indicating if discrete achievement levels should be returned. Defaults to TRUE.

returnCumulative

logical indicating if cumulative achievement levels should be returned. Defaults to FALSE. The first and last categories are the same as defined for discrete levels.

weightVar	character string indicating the weight variable to use. Only the name of the weight variable needs to be included here, and any replicate weights will be automatically included. When this argument is NULL, the function uses the default. Use [showWeights](#) to find the default.
jrrIMax	a numeric value. When using the jackknife variance estimation method, the default estimation option, jrrIMax=1, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The V_{jrr} term (see *Statistical Methods Used in EdSurvey* for the definition of V_{jrr}) can be estimated with any number of plausible values, and values larger than the number of plausible values on the survey (including Inf) will result in all plausible values being used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.
dropOmittedLevels	
	a logical value. When set to the default value (TRUE), it drops those levels in all factor variables that are specified in achievementVars and aggregateBy. Use print on an edsurvey.data.frame to see the omitted levels.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode = list(var1= list(from=c("a", "b", "c"), to ="d")). See Examples.
returnNumberOfPSU	
	a logical value set to TRUE to return the number of primary sampling units (PSUs)
returnVarEstInputs	
	a logical value set to TRUE to return the inputs to the jackknife and imputation variance estimates, which allows for the computation of covariances between estimates.
omittedLevels	this argument is deprecated. Use dropOmittedLevels.

Details

The achievementLevels function applies appropriate weights and the variance estimation method for each edsurvey.data.frame, with several arguments for customizing the aggregation and output of the analysis results. Namely, by using these optional arguments, users can choose to generate the percentage of students performing at each achievement level (discrete), generate the percentage of students performing at or above each achievement level (cumulative), calculate the percentage distribution of students by achievement level (discrete or cumulative) and selected characteristics (specified in aggregateBy), and compute the percentage distribution of students by selected characteristics within a specific achievement level.

Calculation of percentages: The details of the methods are shown in the vignette titled Statistical Methods Used in EdSurvey in "Estimation of Weighted Percentages When Plausible Values Are Present" and are used to calculate all cumulative and discrete probabilities.

When the requested achievement levels are discrete (returnDiscrete = TRUE), the percentage $\mathcal{A}$ is the percentage of students (within the categories specified in aggregateBy) whose scores

lie in the range $[cutPoints_i, cutPoints_{i+1}), i = 0, 1, ..., n$. cutPoints is the score thresholds provided by the user with $cutPoints_0$ taken to be 0. cutPoints are set to NAEP standard cut-points for achievement levels by default. To aggregate by a specific variable, for example, dsex, specify dsex in aggregateBy and all other variables in achievementVars. To aggregate by sub-scale, specify the name of the subscale (e.g., num_oper) in aggregateBy and all other variables in achievementVars.

When the requested achievement levels are cumulative (returnCumulative = TRUE), the percentage $\mathcal{A}$ is the percentage of students (within the categories specified in aggregateBy) whose scores lie in the range $[cutPoints_i, \infty)$, $i = 1, 2, ..., n - 1$. The first and last categories are the same as defined for discrete levels.

Calculation of standard error of percentages: The method used to calculate the standard error of the percentages is described in the vignette titled Statistical Methods Used in EdSurvey in the sections "Estimation of the Standard Error of Weighted Percentages When Plausible Values Are Present, Using the Jackknife Method" and "Estimation of the Standard Error of Weighted Percentages When Plausible Values Are Not Present, Using the Taylor Series Method." For "Estimation of the Standard Error of Weighted Percentages When Plausible Values Are Present, Using the Jackknife Method," the value of jrrIMax sets the value of m^*.

Value

A list containing up to two data frames, one discrete achievement levels (when returnDiscrete is TRUE) and one for cumulative achievement levels (when returnCumulative is TRUE). The data.frame contains the following columns:

Level	one row for each level of the specified achievement cutpoints
Variables in achievementVars	
	one column for each variable in achievementVars and one row for each level of each variable in achievementVars
Percent	the percentage of students at or above each achievement level aggregated as specified by aggregateBy
StandardError	the standard error of the percentage, accounting for the survey sampling methodology. See the vignette titled Statistical Methods Used in EdSurvey.
N	the number of observations in the incoming data (the number of rows when omittedLevels and defaultConditions are set to FALSE)
wtdN	the weighted number of observations in the data
nPSU	the number of PSUs at or above each achievement level aggregated as specified by aggregateBy. Only returned with returnNumberOfPSU=TRUE.

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# discrete achievement levels
achievementLevels(achievementVars=c("composite"), aggregateBy=NULL, data=sdf)

# discrete achievement levels with a different subscale
achievementLevels(achievementVars=c("num_oper"), aggregateBy=NULL, data=sdf)

# cumulative achievement levels
achievementLevels(achievementVars=c("composite"), aggregateBy=NULL, data=sdf,
                  returnCumulative=TRUE)

# cumulative achievement levels with a different subscale
achievementLevels(achievementVars=c("num_oper"), aggregateBy=NULL, data=sdf,
                  returnCumulative=TRUE)

# achievement levels as independent variables, by sex aggregated by composite
achievementLevels(achievementVars=c("composite", "dsex"), aggregateBy="composite",
                  data=sdf, returnCumulative=TRUE)

# achievement levels as independent variables, by sex aggregated by sex
achievementLevels(achievementVars=c("composite", "dsex"), aggregateBy="dsex",
                  data=sdf, returnCumulative=TRUE)

# achievement levels as independent variables, by race aggregated by race
achievementLevels(achievementVars=c("composite", "sdracem"),
                  aggregateBy="sdracem", data=sdf, returnCumulative=TRUE)

# use customized cutpoints
achievementLevels(achievementVars=c("composite"), aggregateBy=NULL, data=sdf,
                  cutpoints = c("Customized Basic" = 200,
                                "Customized Proficient" = 300,
                                "Customized Advanced" = 400))

# use recode to change values for specified variables:
achievementLevels(achievementVars=c("composite", "dsex", "b017451"),
                  aggregateBy = "dsex", sdf,
                  recode=list(b017451=list(from=c("Never or hardly ever",
                                                  "Once every few weeks",
                                                  "About once a week"),
                                           to="Infrequently"),
                              b017451=list(from=c("2 or 3 times a week",
                                                  "Every day"),
                                           to="Frequently")))

## End(Not run)
```

---

as.data.frame   *Coerce to a Data Frame*

Description

Function to coerce a `light.edsurvey.data.frame` to a `data.frame`.

Usage

```
## S3 method for class 'light.edsurvey.data.frame'
as.data.frame(x, ...)
```

Arguments

x	a `light.edsurvey.data.frame`
...	other arguments to be passed to `as.data.frame`

Value

a `data.frame`

Author(s)

Trang Nguyen

---

cbind.light.edsurvey.data.frame
                          Combine R Objects by Rows or Columns

---

Description

Implements `cbind` and `rbind` for `light.edsurvey.data.frame` class. It takes a sequence of `vector`, `matrix`, `data.frame`, or `light.edsurvey.data.frame` arguments and combines by columns or rows, respectively.

Usage

```
## S3 method for class 'light.edsurvey.data.frame'
cbind(..., deparse.level = 1)

## S3 method for class 'light.edsurvey.data.frame'
rbind(..., deparse.level = 1)
```

Arguments

`...`	one or more objects of class `vector`, `data.frame`, `matrix`, or `light.edsurvey.data.frame`
`deparse.level`	integer determining under which circumstances column and row names are built from the actual arguments. See `cbind`.

Details

Because `cbind` and `rbind` are standard generic functions that do not use method dispatch, we set this function as generic, which means it overwrites `base::cbind` and `base::rbind` on loading. If none of the specified elements are of class `light.edsurvey.data.frame`, the function will revert to the standard `base` method. However, to be safe, you might want to explicitly use `base::cbind` when needed after loading the package.

The returned object will contain attributes only from the first `light.edsurvey.data.frame` object in the call to `cbind.light.edsurvey.data.frame`.

Value

a matrix-like object like `matrix` or `data.frame`. Returns a `light.edsurvey.data.frame` if there is at least one `light.edsurvey.data.frame` in the list of arguments.

Author(s)

Trang Nguyen, Michael Lee, and Paul Bailey

`cbind`

---

contourPlot	*Overlaid Scatter and Contour Plots*

Description

Diagnostic plots for regressions can become too dense to interpret. This function helps by adding a contour plot over the points to allow the density of points to be seen, even when an area is entirely covered in points.

Usage

```
contourPlot(
  x,
  y,
  m = 30L,
  xrange,
  yrange,
  xkernel,
  ykernel,
```

```
    nlevels = 9L,
    densityColors = heat.colors(nlevels),
    pointColors = "gray",
    ...
)
```

Arguments

x	numeric vector of the x data to be plotted
y	numeric vector of the y data to be plotted
m	integer value of the number of x and y grid points
xrange	numeric vector of length two indicating x-range of plot; defaults to range(x)
yrange	numeric vector of length two indicating y-range of plot; defaults to range(y)
xkernel	numeric indicating the standard deviation of Normal x kernel to use in generating contour plot
ykernel	numeric indicating the standard deviation of Normal y kernel to use in generating contour plot
nlevels	integer with the number of levels of the contour plot
densityColors	colors to use, specified as in par. Defaults to the heat.colors with nlevels. When specified, colors overrides nlevels.
pointColors	color for the plot points
...	additional arguments to be passed to a plot call that generates the scatter plot and the contour plot

Author(s)

Yuqi Liao and Paul Bailey

Examples

```
## Not run:
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))
lm1 <- lm.sdf(formula=composite ~ pared * dsex + sdracem, data=sdf)
# plot the results
contourPlot(x=lm1$fitted.values,
          y=lm1$residuals[,1], # use only the first plausible value
          m=30,
          xlab="fitted values",
          ylab="residuals",
          main="Figure 1")
# add a line indicating where the residual is zero
abline(0,0)

## End(Not run)
```

cor.sdf   *Bivariate Correlation*

Description

Computes the correlation of two variables on an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list. The correlation accounts for plausible values and the survey design.

Usage

```
cor.sdf(
  x,
  y,
  data,
  method = c("Pearson", "Spearman", "Polychoric", "Polyserial"),
  weightVar = "default",
  reorder = NULL,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  condenseLevels = TRUE,
  fisherZ = if (match.arg(method) %in% "Pearson") {
      TRUE
  } else {
      FALSE
  },
  jrrIMax = Inf,
  verbose = TRUE,
  omittedLevels = deprecated()
)
```

Arguments

x	a character variable name from the data to be correlated with y
y	a character variable name from the data to be correlated with x
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
method	a character string indicating which correlation coefficient (or covariance) is to be computed. One of Pearson (default), Spearman, Polychoric, or Polyserial. For Polyserial, the continuous argument must be x.
weightVar	character indicating the weight variable to use. See Details section in lm.sdf.
reorder	a list of variables to reorder. Defaults to NULL (no variables are reordered). Can be set as reorder = list(var1 = c("a","b","c"), var2 = c("4", "3", "2", "1")). See Examples.

dropOmittedLevels

   a logical value. When set to the default value of TRUE, drops those levels of all
   factor variables that are specified in an edsurvey.data.frame. Use print on
   an edsurvey.data.frame to see the omitted levels.

defaultConditions

   a logical value. When set to the default value of TRUE, uses the default condi-
   tions stored in an edsurvey.data.frame to subset the data. Use print on an
   edsurvey.data.frame to see the default conditions.

recode   a list of lists to recode variables. Defaults to NULL. Can be set as recode =
                   list(var1 = list(from = c("a","b","c"), to = "d")). See Examples.

condenseLevels   a logical value. When set to the default value of TRUE and either x or y is a cat-
                   egorical variable, the function will drop all unused levels and rank the levels of
                   the variable before calculating the correlation. When set to FALSE, the numeric
                   levels of the variable remain the same as in the codebook. See Examples.

fisherZ   for standard error and mean calculations, set to TRUE to use the Fisher Z-transformation
                   (see details), or FALSE to use no transformation of the data. The fisherZ argu-
                   ment defaults to Fisher Z-transformation for Pearson and no transformation for
                   other correlation types.

jrrIMax   a numeric value; when using the jackknife variance estimation method, the de-
                   fault estimation option, jrrIMax=Inf, uses the sampling variance from all plau-
                   sible values as the component for sampling variance estimation. The Vjrr term
                   (see *Statistical Methods Used in EdSurvey*) can be estimated with any number
                   of plausible values, and values larger than the number of plausible values on
                   the survey (including Inf) will result in all plausible values being used. Higher
                   values of jrrIMax lead to longer computing times and more accurate variance
                   estimates.

verbose   a logical value. Set to FALSE to avoid messages about variable conversion.

omittedLevels   this argument is deprecated. Use dropOmittedLevels.

Details

The [getData](#) arguments and [recode.sdf](#) may be useful. (See Examples.) The correlation methods
are calculated as described in the documentation for the wCorr package—see browseVignettes(package="wCorr").

When method is set to polyserial, all x arguments are assumed to be continuous and all y assumed
discrete. Therefore, be mindful of variable selection as this may result in calculations taking a very
long time to complete.

The Fisher Z-transformation is both a variance stabilizing and normalizing transformation for the
Pearson correlation coefficient (Fisher, 1915). The transformation takes the inverse hyperbolic
tangent of the correlation coefficients and then calculates all variances and confidence intervals.
These are then transformed back to the correlation space (values between -1 and 1, inclusive) using
the hyperbolic tangent function. The Taylor series approximation (or delta method) is applied for
the standard errors.

Value

An edsurvey.cor that has print and summary methods.

The class includes the following elements:

correlation	numeric estimated correlation coefficient
Zse	standard error of the correlation (`Vimp` + `Vjrr`). In the case of Pearson, this is calculated in the linear atanh space and is not a standard error in the usual sense.
correlates	a vector of length two showing the columns for which the correlation coefficient was calculated
variables	`correlates` that are discrete
order	a list that shows the order of each variable
method	the type of correlation estimated
Vjrr	the jackknife component of the variance estimate. For Pearson, in the atanh space.
Vimp	the imputation component of the variance estimate. For Pearson, in the atanh space.
weight	the weight variable used
npv	the number of plausible values used
njk	the number of the jackknife replicates used
n0	the original number of observations
nUsed	the number of observations used in the analysis—after any conditions and any listwise deletion of missings is applied
se	the standard error of the correlation, in the correlation ([-1,1]) space
ZconfidenceInterval	the confidence interval of the correlation in the transformation space
confidenceInterval	the confidence interval of the correlation in the correlation ([-1,1]) space
transformation	the name of the transformation used when calculating standard errors

Author(s)

Paul Bailey; relies heavily on the `wCorr` package, written by Ahmad Emad and Paul Bailey

          reorder=list(b013801=c("Less than 100", ">100")))

## End(Not run)
```

---

dim.edsurvey.data.frame

Dimensions of an edsurvey.data.frame or an edsurvey.data.frame.list

---

Description

Returns the dimensions of an `edsurvey.data.frame` or an `edsurvey.data.frame.list`.

Usage

```
## S3 method for class 'edsurvey.data.frame'
dim(x)
```

Arguments

x   an edsurvey.data.frame or an edsurvey.data.frame.list

Value

For an `edsurvey.data.frame`, returns a numeric vector of length two, with the first element being the number of rows and the second element being the number of columns.

For an `edsurvey.data.frame.list`, returns a list of length two, where the first element is named `nrow` and is a numeric vector containing the number of rows for each element of the `edsurvey.data.frame.list`. The second element is named `ncol` and is the number of columns for each element. This is done so that the `nrow` and `ncol` functions return meaningful results, even if nonstandard.

Paul Bailey

DoFCorrection   *Degrees of Freedom*

Description

Calculates the degrees of freedom for a statistic (or of a contrast between two statistics) based on the jackknife and imputation variance estimates.

Usage

```
DoFCorrection(
  varEstA,
  varEstB = varEstA,
  varA,
  varB = varA,
  method = c("WS", "JR")
)
```

Arguments

varEstA	the varEstInput object returned from certain functions, such as `lm.sdf` when `returnVarEstInputs=TRUE`). The variable varA must be on this dataset. See Examples.
varEstB	similar to the varEstA argument. If left blank, both are assumed to come from varEstA. When set, the degrees of freedom are for a contrast between varA and varB, and the varB values are taken from varEstB.
varA	a character that names the statistic in the varEstA argument for which the degrees of freedom calculation is required.
varB	a character that names the statistic in the varEstB argument for which a covariance is required. When varB is specified, returns the degrees of freedom for the contrast between varA and varB.
method	a character that is either WS for the Welch-Satterthwaite formula or JR for the Johnson-Rust correction to the Welch-Satterthwaite formula

Details

This calculation happens under the notion that statistics have little variance within strata, and some strata will contribute fewer than a full degree of freedom.

The functions are not vectorized, so both varA and varB must contain exactly one variable name.

The method used to compute the degrees of freedom is in the vignette titled *Statistical Methods Used in EdSurvey* section "Estimation of Degrees of Freedom."

Value

numeric; the estimated degrees of freedom

Examples

```
## Not run:
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))
lm1 <- lm.sdf(formula=composite ~ dsex + b017451, data=sdf, returnVarEstInputs=TRUE)
summary(lm1)
# this output agrees with summary of lm1 coefficient for dsex
DoFCorrection(lm1$varEstInputs,
              varA="dsexFemale",
              method="JR")
# second example, a covariance term requires more work
# first, estimate the covariance between two regression coefficients
# note that the variable names are parallel to what they are called in lm1 output
covFEveryDay <- varEstToCov(lm1$varEstInputs,
                            varA="dsexFemale",
                            varB="b017451Every day",
                            jkSumMultiplier=
                        EdSurvey:::getAttributes(data=sdf, attribute="jkSumMultiplier"))
# second, find the difference and the SE of the difference
se <- lm1$coefmat["dsexFemale","se"] + lm1$coefmat["b017451Every day","se"] +
      -2*covFEveryDay
# third, calculate the t-statistic
tv <- (coef(lm1)["dsexFemale"] - coef(lm1)["b017451Every day"])/se
# fourth, calculate the p-value, which requires the estimated degrees of freedom
dofFEveryDay <- DoFCorrection(lm1$varEstInputs,
                              varA="dsexFemale",
                              varB="b017451Every day",
                              method="JR")
# finally, the p-value
2*(1-pt(abs(tv), df=dofFEveryDay))

## End(Not run)

downloadCivEDICCS *Instructions for Downloading and Unzipping CivED or ICCS Files*

Description

Provides instructions to download CivED or ICCS data to be processed in readCivEDICCS.

Usage

```
downloadCivEDICCS(years = c(1999, 2009, 2016))
```

Arguments

years   an integer vector indicating the study year. Valid years are 1999, 2009, and
                 2016.

Author(s)

Tom Fink

downloadECLS_K   *Download and Unzip ECLS_K Files*

Description

Uses an Internet connection to download ECLS_K data. Data come from nces.ed.gov zip files. This
function works for 1998 and 2011 data.

Usage

```
downloadECLS_K(root, years = c(1998, 2011), cache = FALSE, verbose = TRUE)
```

Arguments

root   a character string indicating the directory where the ECLS_K data should be
                 stored. Files are placed in a subdirectory named ECLS_K/[year].

years   an integer vector of the assessment years to download. Valid years are 1998 and
                 2011.

cache   a logical value set to process and cache the text (.txt) version of files. This takes
                 a very long time but saves time for future uses of the data. Default value is
                 FALSE.

verbose   a logical value to either print or suppress status message output. The default
                 value is TRUE.

Details

Beginning for the ECLS_K 2011 Study Grade 5 data files, the `ChildK5p.zip` source data file is a `DEFLATE64` compressed zip file. This means that the user must manually extract the contained `childK5p.dat` file using an external zip program capable of handling `DEFLATE64` zip format. As existing R functions are unable to handle this zip format natively.

downloadELS   *Download and Unzip ELS Files*

Description

Uses an Internet connection to download ELS data. Data come from [nces.ed.gov](#) zip files. This function works for 2002 data.

Usage

```
downloadELS(root, years = c(2002), cache = FALSE, verbose = TRUE)
```

Arguments

root   a character string indicating the directory where the ELS data should be stored. Files are placed in a subdirectory named ELS/[year].

years   an integer vector of the assessment years to download. Valid year is 2002 only.

cache	a logical value set to process and cache the text (.txt) version of files. This takes a very long time but saves time for future uses of the data. Default value is FALSE.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

downloadHSLS   *Download and Unzip HSLS Files*

Description

Uses an Internet connection to download HSLS data. Data come from [nces.ed.gov](#) zip files. This function works for 2009 data.

Usage

```
downloadHSLS(root, years = c(2009), cache = FALSE, verbose = TRUE)
```

Arguments

root	a character string indicating the directory where the HSLS data should be stored. Files are placed in a subdirectory named HSLS/[year].
years	an integer vector of the assessment years to download. Valid year is 2009 only.

cache	a logical value set to process and cache the text (.txt) version of files. This takes a very long time but saves time for future uses of the data. Default value is FALSE.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

downloadNHES   *Instructions for Downloading and Unzipping NHES Files*

Description

Provides instructions to download the public-use National Household Education Survey (NHES) data in SPSS (*.sav) format for use with the readNHES function. The data originates from the NCES Online Codebook zip files. This function works for data from the years 1991, 1993, 1995, 1996, 1999, 2001, 2003, 2005, 2007, 2012, 2016, and 2019.

Usage

```
downloadNHES(
  years = c(1991, 1993, 1995, 1996, 1999, 2001, 2003, 2005, 2007, 2012, 2016, 2019)
)
```

Arguments

years   an integer vector of the assessment years. Valid years are 1991, 1993, 1995, 1996, 1999, 2001, 2003, 2005, 2007, 2012, 2016, and 2019. The instructions are the same for each year, this is used as reference only.

Note

The NHES data files are additionally available from the NHES data product page. However, the data files provided at that page do not include all available years of data, and contain inconsistent data file formats.

downloadPIAAC   *Download and Unzip PIAAC Files*

Description

Uses an Internet connection to download PIAAC data to a computer. Data come from the OECD website.

Usage

```
downloadPIAAC(root, cycle = 1, cache = FALSE, verbose = TRUE)
```

Arguments

root	a character string indicating the directory where the PIAAC data should be stored. Files are placed in a folder named PIAAC/cycle [cycle number].
cycle	a numeric value indicating the assessment cycle to download. Valid cycle is 1 only.
cache	a logical value set to process and cache the text (.txt) version of files. This takes a very long time but saves time for future uses of the data. Default value is FALSE.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

Author(s)

Eric Buehler, Paul Bailey, and Trang Nguyen

Examples

```
## Not run:
# download all available data for PIAAC round 1 to "~/PIAAC/Round 1" folder
# root argument will vary by operating system conventions
downloadPIAAC(root="~/")

## End(Not run)
```

---

downloadPIRLS   *Download and Unzip PIRLS Files*

Description

Uses an Internet connection to download PIRLS data. Data come from timssandpirls.bc.edu zip files. This function works for 2001, 2006, 2011, 2016, and 2021 data.

Usage

```
downloadPIRLS(
  root,
  years = c(2001, 2006, 2011, 2016, 2021),
  cache = FALSE,
  verbose = TRUE
)
```

Arguments

root	a character string indicating the directory where the PIRLS data should be stored. Files are placed in a subdirectory named PIRLS/[year].
years	an integer vector of the assessment years to download. Valid years are 2001, 2006, 2011, 2016, and 2021.
cache	a logical value set to process and cache the text (.txt) version of files. This takes a very long time but saves time for future uses of the data. Default value is FALSE.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

Author(s)

Tom Fink

See Also

readPIRLS

Examples

```
## Not run:
# root argument will vary by operating system conventions
downloadPIRLS(year=c(2006, 2011), root = "~/")

# cache=TRUE will download then process the datafiles
downloadPIRLS(year=2011, root = "~/", cache = TRUE)

# set verbose=FALSE for silent output
```

```
# if year not specified, download all years
downloadPIRLS(root="~/", verbose = FALSE)

## End(Not run)
```

---

downloadPISA   *Download and Unzip PISA Files*

Description

Uses an Internet connection to download PISA data to a computer. Data come from the OECD website.

Usage

```
downloadPISA(
  root,
  years = c(2000, 2003, 2006, 2009, 2012, 2015, 2018),
  database = c("INT", "CBA", "FIN"),
  cache = FALSE,
  verbose = TRUE
)
```

Arguments

root	a character string indicating the directory where the PISA data should be stored. Files are placed in a folder named PISA/[year].
years	an integer vector of the assessment years to download. Valid years are 2000, 2003, 2006, 2009, 2012, 2015, and 2018.
database	a character vector to indicate which database to download from. For 2012, three databases are available (INT = International, CBA = Computer-Based Assessment, and FIN = Financial Literacy). For other years, only INT is available (for example, if PISA 2015 financial literacy is to be downloaded, the database argument should be set to INT). Defaults to INT.
cache	a logical value set to process and cache the text (.txt) version of files. This takes a very long time but saves time for future uses of the data. Default value is FALSE.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

Details

The function uses download.file to download files from provided URLs. Some machines might require a different user agent in HTTP(S) requests. If the downloading gives an error or behaves unexpectedly (e.g., a zip file cannot be unzipped or a data file is significantly smaller than expected), users can toggle HTTPUserAgent options to find one that works for their machines. One common alternative option is

```
options(HTTPUserAgent="Mozilla/5.0 (Windows NT 6.1; WOW64; rv:53.0) Gecko/20100101 Firefox/53.0")
```

Beginning in the 2018 data files, the `SPSS_STU_COG.zip` source data file is a DEFLATE64 compressed
zip file. This means that the user must manually extract the contained `CY07_MSU_STU_COG.sav` file
using an external zip program capable of handling DEFLATE64 zip format, as existing R functions
are unable to handle this zip format natively.

downloadSSOCS   *Instructions for Downloading and Unzipping SSOCS Files*

Description

Provides instructions to download School Survey on Crime and Safety (SSOCS) data in SAS (*.sas7bdat) format for use with the readSSOCS function. The data originates from the SSOCS Data Products website at nces.ed.gov. This function works for the following school year datasets: 2000 (1999–2000), 2004 (2003–2004), 2006 (2005–2006), 2008 (2007–2008), 2010 (2009–2010), 2016 (2015–2016), and 2018 (2017–2018).

Usage

```
downloadSSOCS(years = c(2000, 2004, 2006, 2008, 2010, 2016, 2018))
```

Arguments

years   an integer vector of the study years to download. Valid years are as follows: 2000, 2004, 2006, 2008, 2010, 2016, 2018 (see description). The instructions are the same for each year, this is for reference only.

Note

The year parameter value is shortened to the ending year of the school year (e.g., 2006 refers to the 2005–2006 school year data). Manually downloading the data files is required to fulfill the data usage agreement.

downloadTIMSSAdv   *Download and Unzip TIMSS Advanced Files*

Description

Uses an Internet connection to download TIMSS Advanced data. Data come from timssand-pirls.bc.edu zip files. This function works for 1995, 2008, and 2015 data.

Usage

```
downloadTIMSSAdv(
  root,
  years = c(1995, 2008, 2015),
  cache = FALSE,
  verbose = TRUE
)
```

Arguments

root   a character string indicating the directory where the TIMSS Advanced data
            should be stored. Files are placed in a subdirectory named TIMSSAdv/[year].

years   an integer vector of the assessment years to download. Valid years are 1995,
            2008, and 2015.

cache   a logical value set to process and cache the text (.txt) version of files. This takes
            a very long time but saves time for future uses of the data. Default value is
            FALSE.

verbose   a logical value to either print or suppress status message output. The default
            value is TRUE.

download_ePIRLS   *Download and Unzip ePIRLS Files*

Description

Uses an Internet connection to download ePIRLS data. Data come from timssandpirls.bc.edu zip files. This function works for 2016 data.

Usage

```
download_ePIRLS(root, years = c(2016), cache = FALSE, verbose = TRUE)
```

Arguments

root	a character string indicating the directory where the ePIRLS data should be stored. Files are placed in a subdirectory named ePIRLS/[year].
years	an integer vector of the assessment years to download. Valid year is 2016 only.
cache	a logical value set to process and cache the text (.txt) version of files. This takes a very long time but saves time for future uses of the data. Default value is FALSE.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

drawPVs.sdf   *Draw plausible values from an mml fit*

Description

Draw plausible values from an mml fit

Usage

```
## S3 method for class 'sdf'
drawPVs(
  x,
  npv = 5L,
  pvVariableNameSuffix = "_dire",
  data,
  stochasticBeta = FALSE,
  construct = NULL,
  ...
)
```

Arguments

x	a fit from a call to [mml.sdf](), or a summary.mml.sdf, which is a summary of mml.sdf call.
npv	integer indicating the number of plausible values to draw
pvVariableNameSuffix	
	suffix to append to the name of the new plausible values
data	an edsurvey.data.frame or light.edsurvey.data.frame to which the plausible values will be added and from which the covariates and item responses will be taken to generate them
stochasticBeta	logical when TRUE the regressopm coefficients will be drawn from their posterior distribution. Can also be a data frame of values (see Details).

| construct | the construct to draw PVs for |
| ... | additional parameters |

---

edsurvey.data.frame *EdSurvey Class Constructors and Helpers*

Description

Two new classes in EdSurvey are described in this section: the edsurvey.data.frame and light.edsurvey.data.frame. The edsurvey.data.frame class stores metadata about survey data, and data are stored on the disk (via the LaF package), allowing gigabytes of data to be used easily on a machine otherwise inappropriate for manipulating large datasets. The light.edsurvey.data.frame is typically generated by the getData function and stores the data in a data.frame. Both classes use attributes to manage metadata and allow for correct statistics to be used in calculating results; the getAttributes acts as an accessor for these attributes, whereas setAttributes acts as a mutator for the attributes. As a convenience, edsurvey.data.frame implements the $ function to extract a variable.

Usage

```
edsurvey.data.frame(
  userConditions,
  defaultConditions,
  dataList = list(),
  weights,
  pvvars,
  subject,
  year,
  assessmentCode,
  dataType,
  gradeLevel,
  achievementLevels,
  omittedLevels,
  survey,
  country,
  psuVar,
  stratumVar,
  jkSumMultiplier,
  recodes = NULL,
  validateFactorLabels = FALSE,
  forceLower = TRUE,
  reqDecimalConversion = TRUE,
  fr2Path = NULL,
  dim0 = NULL,
  cacheDataLevelName = NULL
)

## S3 method for class 'edsurvey.data.frame'
```

```
x$i

## S3 replacement method for class 'edsurvey.data.frame'
x$name <- value

## S4 method for signature 'edsurvey.data.frame,ANY'
x %in% table

## S4 method for signature 'edsurvey.data.frame.list,ANY'
x %in% table

getAttributes(data, attribute = NULL, errorCheck = TRUE)

setAttributes(data, attribute, value)

getPSUVar(
  data,
  weightVar = attributes(getAttributes(data, "weights"))[["default"]]
)

getStratumVar(
  data,
  weightVar = attributes(getAttributes(data, "weights"))[["default"]]
)
```

Arguments

userConditions	a list of user conditions that includes subsetting or recoding conditions
defaultConditions	
	a list of default conditions that often are set for each survey
dataList	a list of `dataListItem` objects to model the data structure of the survey
weights	a list that stores information regarding weight variables. See Details.
pvvars	a list that stores information regarding plausible values. See Details.
subject	a character that indicates the subject domain of the given data
year	a character or numeric that indicates the year of the given data
assessmentCode	a character that indicates the code of the assessment. Can be `National` or `International`.
dataType	a character that indicates the unit level of the main data. Examples include `Student`, `teacher`, `school`, `Adult Data`.
gradeLevel	a character that indicates the grade level of the given data
achievementLevels	
	a list of achievement-level categories and cutpoints
omittedLevels	a list of default omitted levels for the given data
survey	a character that indicates the name of the survey
country	a character that indicates the country of the given data

psuVar	a character that indicates the PSU sampling unit variable. Ignored when weights have psuVar defined.
stratumVar	a character that indicates the stratum variable. Ignored when weights have stratumVar defined.
jkSumMultiplier	
	a numeric value of the jackknife coefficient (used in calculating the jackknife replication estimation)
recodes	a list of variable recodes of the given data
validateFactorLabels	
	a Boolean that indicates whether the getData function needs to validate factor variables
forceLower	a Boolean; when set to TRUE, will automatically lowercase variable names
reqDecimalConversion	
	a Boolean; when set to TRUE, a getData call will multiply the raw file value by a decimal multiplier
fr2Path	a character file location for NAEP assessments to identify the location of the codebook file in fr2 format
dim0	numeric vector of length two. To speed construction, the dimensions of the data can be provided
cacheDataLevelName	
	a character value set to match the named element in the dataList to utilize the data caching scheme. See details.
x	an edsurvey.data.frame
i	a character, the column name to extract
name	a character vector of the column to edit
value	outside of the assignment context, new value of the given attribute
table	an edsurvey.data.frame or edsurvey.data.frame.list where x is searched for
data	an edsurvey.data.frame
attribute	a character, name of an attribute to get or set
errorCheck	logical; see Details
weightVar	a character indicating the full sample weights. Required in getPSUVar and getStratumVar when there is no default weight.

Details

The weight list has an element named after each weight variable name that is a list with elements jkbase and jksuffixes. The jkbase variable is a single character indicating the jackknife replicate weight base name, whereas jksuffixes is a vector with one element for each jackknife replicate weight. When the two are pasted together, they should form the complete set of the jackknife replicate weights. The weights argument also can have an attribute that is the default weight. If the primary sampling unit and stratum variables change by weight, they also can be defined on the weight list as psuVar and stratumVar. When this option is used, it overrides the psuVar and

stratumVar on the edsurvey.data.frame, which can be left blank. A weight must define only one of psuVar and stratumVar.

The pvvars list has an element for each subject or subscale score that has plausible values. Each element is a list with a varnames element that indicates the column names of the plausible values and an achievementLevel argument that is a named vector of the achievement-level cutpoints.

An edsurvey.data.frame implements a unique data caching mechanism that allows users to create and merge data columns for flexibility. This cache object is a single data.frame that is an element in the edsurvey.data.frame. To accommodate studies with complex data models the cache can only support one data level at this time. The cacheDataLevelName parameter indicates which named element in the dataList the cache is indicated. The default value cacheDataLevelName = NULL will set the first item in the dataList as the cache level for an edsurvey.data.frame.

Value

An object of class edsurvey.data.frame with the following elements:

Elements that store data connections and data codebooks

dataList	a list object containing the surveys dataListItem objects

Elements that store sample design and default subsetting information of the given survey data

userConditions	a list containing all user conditions, set using the subset.edsurvey.data.frame method
defaultConditions	
	the default subsample conditions
weights	a list containing the weights. See Details.
stratumVar	a character that indicates the default strata identification variable name in the data. Often used in Taylor series estimation.
psuVar	a character that indicates the default PSU (sampling unit) identification variable name in the data. Often used in Taylor series estimation.
pvvars	a list containing the plausible values. See Details.
achievementLevels	
	default achievement cutoff scores and names. See Details.
omittedLevels	the levels of the factor variables that will be omitted from the edsurvey.data.frame

Elements that store descriptive information of the survey

survey	the type of survey data
subject	the subject of the data
year	the year of assessment
assessmentCode	the assessment code
dataType	the type of data (e.g., student or school)
gradeLevel	the grade of the dataset contained in the edsurvey.data.frame

Elements used in mml.sdf

dichotParamTab	IRT item parameters for dichotomous items in a data frame

polyParamTab	IRT item parameters for polytomous items in a data frame
adjustedData	IRT item parameter adjustment information in a data frame
testData	IRT transformation constants in a data frame
scoreCard	item scoring information in a data frame
scoreDict	generic scoring information in a data frame
scoreFunction	a function that turns the variables with items in them into numeric scores

EdSurvey Classes

edsurvey.data.frame is an object that stores connection to data on the disk along with important survey sample design information.

edsurvey.data.frame.list is a list of edsurvey.data.frame objects. It often is used in trend or cross-regional analysis in the gap function. See edsurvey.data.frame.list for more information on how to create an edsurvey.data.frame.list. Users also can refer to the vignette titled *Using EdSurvey for Trend Analysis* for examples.

Besides edsurvey.data.frame class, the EdSurvey package also implements the light.edsurvey.data.frame class, which can be used by both EdSurvey and non-EdSurvey functions. More particularly, light.edsurvey.data.frame is a data.frame that has basic survey and sample design information (i.e., plausible values and weights), which will be used for variance estimation in analytical functions. Because it also is a base R data.frame, users can apply base R functions for data manipulation. See the vignette titled *Using the* getData *Function in EdSurvey* for more examples.

Many functions will remove attributes from a data frame, such as a light.edsurvey.data.frame, and the rebindAttributes function can add them back.

Users can get a light.edsurvey.data.frame object by using the getData method with addAttributes=TRUE.

Basic Methods for EdSurvey Classes

Extracting a column from an edsurvey.data.frame

Users can extract a column from an edsurvey.data.frame object using $ or [] like a normal data frame.

Extracting and updating attributes of an object of class edsurvey.data.frame *or* light.edsurvey.data.frame

Users can use the getAttributes method to extract any attribute of an edsurvey.data.frame or a light.edsurvey.data.frame. The errorCheck parameter has a default value ofTRUE, which throws an error if an attribute is not found. Setting errorCheck = FALSE will suppress error checking, and return NULL if an attribute can't be found.

A light.edsurvey.data.frame will not have attributes related to data connection because data have already been read in memory.

If users want to update an attribute (i.e., omittedLevels), they can use the setAttributes method.

edsurvey.data.frame.list

EdSurvey Dataset Vectorization

Description

The edsurvey.data.frame.list function creates an edsurvey.data.frame.list object from a series of edsurvey.data.frame objects. append.edsurvey.data.frame.list creates an edsurvey.data.frame.list from two edsurvey.data.frame or edsurvey.data.frame.list objects.

An edsurvey.data.frame.list is useful for looking at data, for example, across time or graphically, and reduces repetition in function calls. The user may specify a variable that varies across the edsurvey.data.frame objects that is then included in further output.

Usage

```
edsurvey.data.frame.list(datalist, cov = NULL, labels = NULL)

append.edsurvey.data.frame.list(sdfA, sdfB, labelsA = NULL, labelsB = NULL)
```

Arguments

datalist   a list of edsurvey.data.frames to be combined

cov	a character vector that indicates what varies across the edsurvey.data.frame objects. Guessed if not supplied. For example, if several edsurvey.data.frames for several different countries are supplied, then cov would be set to the country.
labels	a character vector that specifies labels. Must be the same length as datalist. Not needed if cov exists or can be guessed. See Examples.
sdfA	an edsurvey.data.frame or an edsurvey.data.frame.list to be combined
sdfB	an edsurvey.data.frame or an edsurvey.data.frame.list to be combined
labelsA	a character vector that specifies labels for sdfA when creating the new edsurvey.data.frame.list.
labelsB	a character vector that specifies labels for sdfB when creating the new edsurvey.data.frame.list.

Details

The edsurvey.data.frame.list can be used in place of an edsurvey.data.frame in function calls, and results are returned for each of the component edsurvey.data.frames, with the organization of the results varying by the particular method.

An edsurvey.data.frame.list can be created from several edsurvey.data.frame objects that are related; for example, all are NAEP mathematics assessments but have one or more differences (e.g., they are all from different years). Another example could be data from multiple countries for an international assessment.

When cov and labels are both missing, edsurvey.data.frame.list attempts to guess what variables may be varying and uses those. When there are no varying covariates, generic labels are automatically generated.

Value

edsurvey.data.frame.list returns an edsurvey.data.frame.list with elements

datalist	a list of edsurvey.data.frame objects
covs	a character vector of key variables that vary within the edsurvey.data.frame.list. When labels are included, they will be included in covs. In the unusual circumstance that sdfA or sdfB is an edsurvey.data.frame.list has covs, and labels are not supplied, the covs are simply pasted together with colons between them.

append.edsurvey.data.frame.list returns an edsurvey.data.frame.list with elements

datalist	a list of edsurvey.data.frame objects
covs	a character vector of key variables that vary within the edsurvey.data.frame.list. When labels are included, they will be included in covs.

---

edsurveyTable   *EdSurvey Tables With Conditional Means*

Description

Returns a summary table (as a data.frame) that shows the number of students, the percentage
of students, and the mean value of the outcome (or left-hand side) variable by the predictor (or
right-hand side) variable(s).

Usage

```
edsurveyTable(
  formula,
  data,
  weightVar = NULL,
  jrrIMax = 1,
  pctAggregationLevel = NULL,
  returnMeans = TRUE,
  returnSepct = TRUE,
  varMethod = c("jackknife", "Taylor"),
  drop = FALSE,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  returnVarEstInputs = FALSE,
  omittedLevels = deprecated()
)
```

Arguments

formula	object of class `formula`, potentially with a subject scale or subscale on the left-hand side and variables to tabulate on the right-hand side. When the left-hand side of the formula is omitted and `returnMeans` is `TRUE`, then the default subject scale or subscale is used. You can find the default composite scale and all subscales using the function [showPlausibleValues](). Note that the order of the right-hand side variables affects the output.
data	object of class edsurvey.data.frame. See [readNAEP]() for how to generate an edsurvey.data.frame.
weightVar	character string indicating the weight variable to use. Note that only the name of the weight variable needs to be included here, and any replicate weights will be automatically included. When this argument is `NULL`, the function uses the default. Use [showWeights]() to find the default.
jrrIMax	a numeric value; when using the jackknife variance estimation method, the default estimation option, `jrrIMax=1`, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The V_{jrr} term (see the Details section of [lm.sdf]() to see the definition of V_{jrr}) can be estimated with any number of plausible values, and values larger than the number of plausible values on the survey (including `Inf`) will result in all of the plausible values being used. Higher values of `jrrIMax` lead to longer computing times and more accurate variance estimates.
pctAggregationLevel	the percentage variable sums up to 100 for the first `pctAggregationLevel` columns. So, when set to `0`, the PCT column adds up to 1 across the entire sample. When set to `1`, the PCT column adds up to 1 within each level of the first variable on the right-hand side of the formula; when set to `2`, then the percentage adds up to 100 within the interaction of the first and second variable, and so on. Default is `NULL`, which will result in the lowest feasible aggregation level. See Examples section.
returnMeans	a logical value; set to `TRUE` (the default) to get the `MEAN` and `SE(MEAN)` columns in the returned table described in the Value section.
returnSepct	set to `TRUE` (the default) to get the `SEPCT` column in the returned table described in the Value section.
varMethod	a character set to `jackknife` or `Taylor` that indicates the variance estimation method to be used.
drop	a logical value. When set to the default value of `FALSE`, when a single column is returned, it is still represented as a `data.frame` and is not converted to a vector.
dropOmittedLevels	a logical value. When set to the default value of `TRUE`, drops those levels of all factor variables that are specified in an edsurvey.data.frame. Use `print` on an edsurvey.data.frame to see the omitted levels.
defaultConditions	a logical value. When set to the default value of `TRUE`, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use `print` on an edsurvey.data.frame to see the default conditions.

recode   a list of lists to recode variables. Defaults to NULL. Can be set as `recode = list(var1 = list(from = c("a", "b", "c"), to = "c"))`.

returnVarEstInputs

          a logical value set to `TRUE` to return the inputs to the jackknife and imputation variance estimates, which allows for the computation of covariances between estimates.

omittedLevels   this argument is deprecated. Use `dropOmittedLevels`.

Details

This method can be used to generate a simple one-way, two-way, or *n*-way table with unweighted and weighted *n* values and percentages. It also can calculate the average of the subject scale or subscale for students at each level of the cross-tabulation table.

A detailed description of all statistics is given in the vignette titled *Statistical Methods Used in EdSurvey*.

Value

A table with the following columns:

RHS levels   one column for each right-hand side variable. Each row regards students who are at the levels shown in that row.

N   count of the number of students in the survey in the RHS levels

WTD_N   the weighted *N* count of students in the survey in RHS levels

PCT   the percentage of students at the aggregation level specified by `pctAggregationLevel` (see Arguments). See the vignette titled *Statistical Methods Used in EdSurvey* in the section "Estimation of Weighted Percentages" and its first subsection "Estimation of Weighted Percentages When Plausible Values Are Not Present."

SE(PCT)   the standard error of the percentage, accounting for the survey sampling methodology. When `varMethod` is the `jackknife`, the calculation of this column is described in the vignette titled *Statistical Methods Used in EdSurvey* in the section "Estimation of the Standard Error of Weighted Percentages When Plausible Values Are Not Present, Using the Jackknife Method." When `varMethod` is set to `Taylor`, the calculation of this column is described in "Estimation of the Standard Error of Weighted Percentages When Plausible Values Are Not Present, Using the Taylor Series Method."

MEAN   the mean assessment score for units in the RHS levels, calculated according to the vignette titled *Statistical Methods Used in EdSurvey* in the section "Estimation of Weighted Means When Plausible Values Are Present."

SE(MEAN)   the standard error of the MEAN column (the mean assessment score for units in the RHS levels), calculated according to the vignette titled *Statistical Methods Used in EdSurvey* in the sections "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Jackknife Method" or "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Taylor Series Method," depending on the value of `varMethod`.

When `returnVarEstInputs` is TRUE, two additional elements are returned. These are `meanVarEstInputs` and `pctVarEstInputs` and regard the MEAN and PCT columns, respectively. These two objects can be used for calculating covariances with `varEstToCov`.

edsurveyTable2pdf   *PDF File From an edsurveyTable*

Description

Produces the LaTeX code and compiles to a PDF file from the `edsurveyTable` results.

Usage

```
edsurveyTable2pdf(
  data,
  formula,
  caption = NULL,
  filename = "",
  toCSV = "",
  returnMeans = TRUE,
  estDigits = 2,
  seDigits = 3
)
```

Arguments

data	the result of a call to [edsurveyTable](#)
formula	a formula of the form LHS ~ RHS to cast the edsurveyTable results from long format to wide format. This formula takes the form LHS ~ RHS (e.g., var1 + var2 ~ var3). The order of the entries in the formula is essential.
caption	character vector of length one or two containing the table's caption or title. If the length is two, the second item is the "short caption" used when LaTeX generates a List of Tables. Set to NULL to suppress the caption. Default value is NULL.
filename	a character string containing filenames and paths. By default (filename = ""), table will be saved in the working directory (getwd()). Use filename = "CONSOLE" to print LaTeX code in R console without generating a PDF file.
toCSV	a character string containing filenames and paths of .csv table output. "" indicates no .csv output. toCSV is independent to filename, so both a csv file and PDF file would be generated if both filename and toCSV were specified.
returnMeans	a logical value set to TRUE (the default) to generate a PDF with the MEAN and SE(MEAN). It is set to FALSE to generate a PDF with the PCT and SE(PCT). See Value in [edsurveyTable](#).
estDigits	an integer indicating the number of decimal places to be used for estimates. Negative values are allowed. See Details.
seDigits	an integer indicating the number of decimal places to be used for standard errors. Negative values are allowed.

Details

Rounding to a negative number of digits means rounding to a power of 10, so, for example, estDigits = -2 rounds estimates to the nearest hundred.

Note

For more details, see the vignette titled *Producing* LaTeX *Tables From* edsurveyTable *Results With* edsurveyTable2pdf.

es_round   *round ouptut of EdSurvey functions before printing*

Description

Applies rounding rules

Usage

```
es_round(
  object,
  round_n = getOption("EdSurvey_round_n_function"),
  round_pop_n = getOption("EdSurvey_round_pop_n_function"),
  round_est = getOption("EdSurvey_round_est_function"),
  round_est_se = getOption("EdSurvey_round_est_se_function"),
  round_pct = getOption("EdSurvey_round_pct_function"),
  round_pct_se = getOption("EdSurvey_round_pct_se_function"),
  round_specific_element = NULL,
  ...
)
```

Arguments

`object`	the object (usually the result of an analysis function) to be rounded
`round_n`	function used to round sample n-sizes
`round_pop_n`	function used to round weighted n-sizes, these are also called population size estimates
`round_est`	function used to round estimates; examples include means and percentiles of scores, as well as regression coefficients
`round_est_se`	function used to round standard errors of estimates
`round_pct`	function used to round percentages
`round_pct_se`	function used to round the standard errors of percentages
`round_specific_element`	
	a list of rounding functions, the function is applied to elements with that name. See Examples
`...`	additional arguments passed to methods
	rounds every statistic that is a function of data, including the header and tables

Value

the object is returned, with relevant elements rounded

Author(s)

Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))

# by default uses jackknife variance method using replicate weights
es1 <- edsurveyTable(formula=composite ~ dsex + b017451, data=sdf)
# turn on rounding by default
options(EdSurvey_round_output= TRUE)
es1
# turn off rounding by default
options(EdSurvey_round_output= FALSE)

# request rounding for this outpt
print(es1, use_es_round=TRUE)
# round, then print

# round the PCT column to one digit
es_round(es1, round_specific_element=list(PCT=roundn(1)))

## End(Not run)
```

---

gap   *Gap Analysis*

Description

Compares the average levels of a variable between two groups that potentially share members.

Usage

```
gap(
  variable,
  data,
  groupA = "default",
  groupB = "default",
  percentiles = NULL,
  achievementLevel = NULL,
  achievementDiscrete = FALSE,
  stDev = FALSE,
  targetLevel = NULL,
  weightVar = NULL,
  jrrIMax = 1,
  varMethod = c("jackknife"),
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  referenceDataIndex = 1,
  returnVarEstInputs = FALSE,
  returnSimpleDoF = FALSE,
  returnSimpleN = FALSE,
  returnNumberOfPSU = FALSE,
  noCov = FALSE,
  pctMethod = c("unbiased", "symmetric", "simple"),
  includeLinkingError = FALSE,
  omittedLevels = deprecated()
)
```

Arguments

variable	a character indicating the variable to be compared, potentially with a subject scale or subscale
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
groupA	an expression or character expression that defines a condition for the subset. This subset will be compared to groupB. If not specified, it will define a whole sample as in data.
groupB	an expression or character expression that defines a condition for the subset. This subset will be compared to groupA. If not specified, it will define a whole sample as in data. If set to NULL, estimates for the second group will be dropped.

percentiles	a numeric vector. The gap function calculates the mean when this argument is omitted or set to NULL. Otherwise, the gap at the percentile given is calculated.
achievementLevel	
	the achievement level(s) at which percentages should be calculated
achievementDiscrete	
	a logical indicating if the achievement level specified in the achievementLevel argument should be interpreted as discrete so that just the percentage in that particular achievement level will be included. Defaults to FALSE so that the percentage at or above that achievement level will be included in the percentage.
stDev	a logical, set to TRUE to calculate the gap in standard deviations.
targetLevel	a character string. When specified, calculates the gap in the percentage of students at targetLevel in the variable argument. This is useful for comparing the gap in the percentage of students at a survey response level.
weightVar	a character indicating the weight variable to use. See Details.
jrrIMax	a numeric value; when using the jackknife variance estimation method, the default estimation option, jrrIMax=1, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The Vjrr term, or sampeling variance term, can be estimated with any number of plausible values, and values larger than the number of plausible values on the survey (including Inf) will result in all plausible values being used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.
varMethod	deprecated parameter, gap always uses the jackknife variance estimation
dropOmittedLevels	
	a logical value. When set to the default value of TRUE, drops those levels of all factor variables. Use print on an edsurvey.data.frame to see the omitted levels.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode = list(var1 = list(from = c("a", "b", "c"), to = "d")).
referenceDataIndex	
	a numeric used only when the data argument is an edsurvey.data.frame.list, indicating which dataset is the reference dataset that other datasets are compared with. Defaults to 1.
returnVarEstInputs	
	a logical value; set to TRUE to return the inputs to the jackknife and imputation variance estimates which allows for the computation of covariances between estimates.
returnSimpleDoF	
	a logical value set to TRUE to return the degrees of freedom for some statistics (see Value section) that do not have a *t*-test; useful primarily for further computation
returnSimpleN	a logical value set to TRUE to add the count (*n*-size) of observations included in groups A and B in the percentage object

returnNumberOfPSU

  a logical value set to TRUE to return the number of PSUs used in the calculation

noCov set the covariances to zero in result

pctMethod a character that is one of unbiased or simple. See the help for percentile for more information.

includeLinkingError

  a logical value set to TRUE to include the linking error in variance estimation. Standard errors (e.g., diffAAse, diffBBse, and diffABABse) and *p*-values (e.g., diffAApValue, diffBBpValue, and diffABABpValue) would be adjusted for comparisons between digitally based assessments (DBA) and paper-based assessments (PBA) data. This option is supported only for NAEP data.

omittedLevels this argument is deprecated. Use dropOmittedLevels.

Details

This function calculates the gap between groupA and groupB (which may be omitted to indicate the full sample). The gap is calculated for one of four statistics:

the gap in means The mean score gap (in the score variable) identified in the variable argument. This is the default. The means and their standard errors are calculated using the methods described in the [lm.sdf](lm.sdf) function documentation.

the gap in percentiles The gap between respondents at the percentiles specified in the percentiles argument. This is returned when the percentiles argument is defined. The mean and standard error are computed as described in the percentile function documentation.

the gap in achievement levels The gap in the percentage of students at (when achievementDiscrete is TRUE) or at or above (when achievementDiscrete is FALSE) a particular achievement level. This is used when the achievementLevel argument is defined. The mean and standard error are calculated as described in the achievementLevels function documentation.

the gap in a survey response The gap in the percentage of respondents responding at targetLevel to variable. This is used when targetLevel is defined. The mean and standard deviation are calculated as described in the edsurveyTable function documentation.

Value

The return type depends on if the class of the data argument is an edsurvey.data.frame or an edsurvey.data.frame.list. Both include the call (called call), a list called labels, an object named percentage that shows the percentage in groupA and groupB, and an object that shows the gap called results.

The labels include the following elements:

definition the definitions of the groups

nFullData the *n*-size for the full dataset (before applying the definition)

nUsed the *n*-size for the data after the group is subsetted and other restrictions (such as omitted values) are applied

nPSU the number of PSUs used in calculation–only returned when returnNumberOfPSU = TRUE

The percentages are computed according to the vignette titled *Statistical Methods Used in EdSurvey* in the section "Estimation of Weighted Percentages When Plausible Values Are Not Present." The standard errors are calculated according to "Estimation of the Standard Error of Weighted Percentages When Plausible Values Are Not Present, Using the Jackknife Method." Standard errors of differences are calculated as the square root of the typical variance formula

$$Var(A - B) = Var(A) + Var(B) - 2Cov(A, B)$$

where the covariance term is calculated as described in the vignette titled *Statistical Methods Used in EdSurvey* in the section "Estimation of Covariances." These degrees of freedom are available only with the jackknife variance estimation. The degrees of freedom used for hypothesis testing are always set to the number of jackknife replicates in the data.

the data argument is an edsurvey.data.frame When the data argument is an edsurvey.data.frame, gap returns an S3 object of class gap.

The percentage object is a numeric vector with the following elements:

pctA	the percentage of respondents in groupA compared with the whole sample in data
pctAse	the standard error on the percentage of respondents in groupA
dofA	degrees of freedom appropriate for a *t*-test involving pctA. This value is returned only if returnSimpleDoF=TRUE.
pctB	the percentage of respondents in groupB.
pctBse	the standard error on the percentage of respondents in groupB
dofB	degrees of freedom appropriate for a *t*-test involving pctA. This value is returned only if returnSimpleDoF=TRUE.
diffAB	the value of pctA minus pctB
covAB	the covariance of pctA and pctB; used in calculating diffABse.
diffABse	the standard error of pctA minus pctB
diffABpValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffAB is zero
dofAB	degrees of freedom used in calculating diffABpValue

The results object is a numeric data frame with the following elements:

estimateA	the mean estimate of groupA (or the percentage estimate if achievementLevel or targetLevel is specified)
estimateAse	the standard error of estimateA
dofA	degrees of freedom appropriate for a *t*-test involving meanA. This value is returned only if returnSimpleDoF=TRUE.
estimateB	the mean estimate of groupB (or the percentage estimate if achievementLevel or targetLevel is specified)
estimateBse	the standard error of estimateB
dofB	degrees of freedom appropriate for a *t*-test involving meanB. This value is returned only if returnSimpleDoF=TRUE.

diffAB	the value of estimateA minus estimateB
covAB	the covariance of estimateA and estimateB. Used in calculating diffABse.
diffABse	the standard error of diffAB
diffABpValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffAB is zero.
dofAB	degrees of freedom used for the *t*-test on diffAB

If the gap was in achievement levels or percentiles and more than one percentile or achievement level is requested, then an additional column labeled percentiles or achievementLevel is included in the results object.

When results has a single row and when returnVarEstInputs is TRUE, the additional elements varEstInputs and pctVarEstInputs also are returned. These can be used for calculating covariances with varEstToCov.

the data argument is an edsurvey.data.frame.list When the data argument is an edsurvey.data.frame.list, gap returns an S3 object of class gapList.

The results object in the edsurveyResultList is a data.frame. Each row regards a particular dataset from the edsurvey.data.frame, and a reference dataset is dictated by the referenceDataIndex argument.

The percentage object is a data.frame with the following elements:

covs	a data frame with a column for each column in the covs. See previous section for more details.
...	all elements in the percentage object in the previous section
diffAA	the difference in pctA between the reference data and this dataset. Set to NA for the reference dataset.
covAA	the covariance of pctA in the reference data and pctA on this row. Used in calculating diffAAse.
diffAAse	the standard error for diffAA
diffAApValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffAA is zero
diffBB	the difference in pctB between the reference data and this dataset. Set to NA for the reference dataset.
covBB	the covariance of pctB in the reference data and pctB on this row. Used in calculating diffAAse.
diffBBse	the standard error for diffBB
diffBBpValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffBB is zero
diffABAB	the value of diffAB in the reference dataset minus the value of diffAB in this dataset. Set to NA for the reference dataset.
covABAB	the covariance of diffAB in the reference data and diffAB on this row. Used in calculating diffABABse.
diffABABse	the standard error for diffABAB

diffABABpValue the *p*-value associated with the *t*-test used for the hypothesis test that diffABAB
                is zero

The results object is a data.frame with the following elements:

...	all elements in the results object in the previous section
diffAA	the value of groupA in the reference dataset minus the value in this dataset. Set to NA for the reference dataset.
covAA	the covariance of meanA in the reference data and meanA on this row. Used in calculating diffAAse.
diffAAse	the standard error for diffAA
diffAApValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffAA is zero
diffBB	the value of groupB in the reference dataset minus the value in this dataset. Set to NA for the reference dataset.
covBB	the covariance of meanB in the reference data and meanB on this row. Used in calculating diffBBse.
diffBBse	the standard error for diffBB
diffBBpValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffBB is zero
diffABAB	the value of diffAB in the reference dataset minus the value of diffAB in this dataset. Set to NA for the reference dataset.
covABAB	the covariance of diffAB in the reference data and diffAB on this row. Used in calculating diffABABse.
diffABABse	the standard error for diffABAB
diffABABpValue	the *p*-value associated with the *t*-test used for the hypothesis test that diffABAB is zero
sameSurvey	a logical value indicating if this line uses the same survey as the reference line. Set to NA for the reference line.

getAllItems	*Retrieve IRT Item Variable Names*

Description

Retrieves the IRT item variable names associated with construct names for use with `mml.sdf` function.

Usage

```
getAllItems(sdf, construct = NULL)
```

Arguments

sdf	an `edsurvey.data.frame` or `light.edsurvey.data.frame` containing IRT information. Supports NAEP and TIMSS 2011, 2015, and 2019 studies only.
construct	a character value (or vector) for which to return the associated item variable names. Default value is `NULL` which returns all IRT item variable names. Use the `showPlausibleValues` function to view construct details.

Value

a character vector of the items names associated for the values in `construct`.

Note

if `construct` is a vector, all item names will be returned for those constructs. Use `getAllItems` with `getData` when creating a `light.edsurvey.data.frame`, see example for use.

Author(s)

Tom Fink, Sun-Joo Lee, Eric Buehler, and Paul Bailey

getData | *Read Data to a Data Frame*

Description

Reads in selected columns to a data.frame or a light.edsurvey.data.frame. On an edsurvey.data.frame, the data are stored on disk.

Usage

```
getData(
  data,
  varnames = NULL,
  drop = FALSE,
  dropUnusedLevels = TRUE,
```

```
    dropOmittedLevels = TRUE,
    defaultConditions = TRUE,
    formula = NULL,
    recode = NULL,
    includeNaLabel = FALSE,
    addAttributes = FALSE,
    returnJKreplicates = TRUE,
    omittedLevels = deprecated()
)
```

Arguments

data	an edsurvey.data.frame or a light.edsurvey.data.frame
varnames	a character vector of variable names that will be returned. When both varnames and a formula are specified, variables associated with both are returned. Set to NULL by default.
drop	a logical value. When set to the default value of FALSE, when a single column is returned, it is still represented as a data.frame and is not converted to a vector.
dropUnusedLevels	
	a logical value. When set to the default value of TRUE, drops unused levels of all factor variables.
dropOmittedLevels	
	a logical value. When set to the default value of TRUE, drops those levels of all factor variables that are specified in an edsurvey.data.frame. Use print on an edsurvey.data.frame to see the omitted levels. The omitted levels also can be adjusted with setAttributes; see Examples.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
formula	a formula. When included, getData returns data associated with all variables of the formula. When both varnames and a formula are specified, the variables associated with both are returned. Set to NULL by default.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode = list(var1 = list(from = c("a","b","c"), to = "d")). See Examples.
includeNaLabel	a logical value to indicate if NA (missing) values are returned as literal NA values or as factor levels coded as NA
addAttributes	a logical value set to TRUE to get a data.frame that can be used in calls to other functions that usually would take an edsurvey.data.frame. This data.frame also is called a light.edsurvey.data.frame. See Description section in edsurvey.data.frame for more information on light.edsurvey.data.frame.
returnJKreplicates	
	a logical value indicating if JK replicate weights should be returned. Defaults to TRUE.
omittedLevels	this argument is deprecated. Use dropOmittedLevels.

Details

By default, an `edsurvey.data.frame` does not have data read into memory until `getData` is called and returns a data frame. This structure allows EdSurvey to have a minimal memory footprint. To keep the footprint small, you need to limit `varnames` to just the necessary variables.

There are two methods of attaching survey attributes to a `data.frame` to make it usable by the functions in the EdSurvey package (e.g., `lm.sdf`): (a) setting the `addAttributes` argument to `TRUE` at in the call to `getData` or (b) by appending the attributes to the data frame with `rebindAttributes`.

When `getData` is called, it returns a data frame. Setting the `addAttributes` argument to `TRUE` adds the survey attributes and changes the resultant `data.frame` to a `light.edsurvey.data.frame`.

Alternatively, a `data.frame` can be coerced into a `light.edsurvey.data.frame` using `rebindAttributes`. See Examples in the [rebindAttributes](#) documentation.

If both `formula` and `varnames` are populated, the variables on both will be included.

See the vignette titled *Using the `getData` Function in EdSurvey* for long-form documentation on this function.

Value

When `addAttributes` is `FALSE`, `getData` returns a `data.frame` containing data associated with the requested variables. When `addAttributes` is `TRUE`, `getData` returns a `light.edsurvey.data.frame`.

getNHES_SurveyInfo   *Get NHES Survey Code Definitions and Survey Meta-data*

Description

This function returns a data.frame object that defines NHES Survey Codes and survey parameters
that are compatible with the readNHES function for use. The resulting data.frame object is useful
for user reference or other advanced techniques.

Usage

```
getNHES_SurveyInfo()
```

Note

Any changes or modifications to the data.frame object will not change the behavior of readNHES. This function should be treated only as a read-only source of information.

Author(s)

Tom Fink

See Also

readNHES, viewNHES_SurveyCodes

Examples

```
## Not run:
  #retrieves the NHES survey meta-data to a data.frame
  surveyInfo <- getNHES_SurveyInfo()

  #View the survey data where the year is equal to 2016 in RStudio
  View(subset(surveyInfo, surveyInfo$Year==2016))

## End(Not run)
```

---

getPlausibleValue   *Get Plausible Value Variables*

Description

Gets the set of variables on an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list associated with the given subject or subscale.

Usage

```
getPlausibleValue(var, data)
```

Arguments

var	a character vector naming the subject scale or subscale
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

Details

This function will return a set of plausible value names for variables that hasPlausibleValue returns as true.

Value

a character vector of the set of variable names for the plausible values

Author(s)

Michael Lee and Paul Bailey

See Also

showPlausibleValues, updatePlausibleValue

Examples

```
## Not run:
# read in the example data (generated, not real student data)

getPlausibleValue(var="composite", data=sdf)

## End(Not run)
```

---

getWeightJkReplicates   *Retrieve the Jackknife Replicate Weights*

Description

Returns the jackknife replicate weights on an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list associated with a weight variable.

Usage

```
getWeightJkReplicates(var, data)
```

Arguments

var	character indicating the name of the weight variable for which the jackknife replicate weights are desired
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

Value

a character vector of the jackknife replicate weights

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

getWeightJkReplicates(var="origwt", data=sdf)

## End(Not run)
```

---

glm.sdf   *EdSurvey Generalized Linear Models*

Description

Fits a logit or probit that uses weights and variance estimates appropriate for the edsurvey.data.frame, the light.edsurvey.data.frame, or the edsurvey.data.frame.list.

Usage

```
glm.sdf(formula, family = binomial(link = "logit"), data,
  weightVar = NULL, relevels = list(),
  varMethod=c("jackknife", "Taylor"), jrrIMax = 1,
  dropOmittedLevels = TRUE, defaultConditions = TRUE, recode = NULL,
  returnNumberOfPSU=FALSE, returnVarEstInputs = FALSE,
  omittedLevels = deprecated())

logit.sdf(
  formula,
  data,
  weightVar = NULL,
  relevels = list(),
  varMethod = c("jackknife", "Taylor"),
  jrrIMax = 1,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  returnNumberOfPSU = FALSE,
  returnVarEstInputs = FALSE,
  omittedLevels = deprecated()
)

probit.sdf(
  formula,
  data,
  weightVar = NULL,
  relevels = list(),
  varMethod = c("jackknife", "Taylor"),
```

```
    jrrIMax = 1,
    dropOmittedLevels = TRUE,
    defaultConditions = TRUE,
    recode = NULL,
    returnNumberOfPSU = FALSE,
    returnVarEstInputs = FALSE,
    omittedLevels = deprecated()
)
```

Arguments

formula	a formula for the linear model. See glm. For logit and probit, we recommend using the I() function to define the level used for success. (See Examples.)
family	the glm.sdf function currently fits only the binomial outcome models, such as logit and probit, although other link functions are available for binomial models. See the link argument in the help for family.
data	an edsurvey.data.frame
weightVar	character indicating the weight variable to use (see Details). The weightVar must be one of the weights for the edsurvey.data.frame. If NULL, uses the default for the edsurvey.data.frame.
relevels	a list; used to change the contrasts from the default treatment contrasts to the treatment contrasts with a chosen omitted group. The name of each element should be the variable name, and the value should be the group to be omitted.
varMethod	a character set to "jackknife" or "Taylor" that indicates the variance estimation method to be used. See Details.
jrrIMax	the Vjrr sampling variance term (see *Statistical Methods Used in EdSurvey*) can be estimated with any positive number of plausible values and is estimated on the lower of the number of available plausible values and jrrIMax. When jrrIMax is set to Inf, all plausible values will be used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.
dropOmittedLevels	
	a logical value. When set to the default value of TRUE, drops those levels of all factor variables that are specified in edsurvey.data.frame. Use print on an edsurvey.data.frame to see the omitted levels.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode= list(var1= list(from= c("a", "b", "c"), to="d")).
returnNumberOfPSU	
	a logical value set to TRUE to return the number of primary sampling units (PSUs)
returnVarEstInputs	
	a logical value set to TRUE to return the inputs to the jackknife and imputation variance estimates, which allow for the computation of covariances between estimates.

omittedLevels   this argument is deprecated. Use dropOmittedLevels

Details

This function implements an estimator that correctly handles left-hand side variables that are logical, allows for survey sampling weights, and estimates variances using the jackknife replication or Taylor series. The vignette titled *Statistical Methods Used in EdSurvey* describes estimation of the reported statistics and how it depends on varMethod.

The coefficients are estimated using the sample weights according to the section "Estimation of Weighted Means When Plausible Values Are Not Present" or the section "Estimation of Weighted Means When Plausible Values Are Present," depending on if there are assessment variables or variables with plausible values in them.

How the standard errors of the coefficients are estimated depends on the presence of plausible values (assessment variables), But once it is obtained, the *t* statistic is given by

$$ t = \frac{\hat{\beta}}{\sqrt{\mathrm{var}(\hat{\beta})}} $$

where $\hat{\beta}$ is the estimated coefficient and $\mathrm{var}(\hat{\beta})$ is its variance of that estimate.

logit.sdf and probit.sdf are included for convenience only; they give the same results as a call to glm.sdf with the binomial family and the link function named in the function call (logit or probit). By default, glm fits a logistic regression when family is not set, so the two are expected to give the same results in that case. Other types of generalized linear models are not supported.

Variance estimation of coefficients: All variance estimation methods are shown in the vignette titled *Statistical Methods Used in EdSurvey*. When the predicted value does not have plausible values and varMethod is set to jackknife, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Not Present, Using the Jackknife Method."

When plausible values are present and varMethod is set to jackknife, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Jackknife Method."

When the predicted value does not have plausible values and varMethod is set to Taylor, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Not Present, Using the Taylor Series Method."

When plausible values are present and varMethod is set to Taylor, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Taylor Series Method."

Value

An edsurveyGlm with the following elements:

call	the function call
formula	the formula used to fit the model
coef	the estimates of the coefficients
se	the standard error estimates of the coefficients

Vimp	the estimated variance caused by uncertainty in the scores (plausible value variables)
Vjrr	the estimated variance from sampling
M	the number of plausible values
nPSU	the number of PSUs used in the calculation
varm	the variance estimates under the various plausible values
coefm	the values of the coefficients under the various plausible values
coefmat	the coefficient matrix (typically produced by the summary of a model)
weight	the name of the weight variable
npv	the number of plausible values
njk	the number of the jackknife replicates used
varMethod	always jackknife
varEstInputs	when returnVarEstInputs is TRUE, this element is returned. These are used for calculating covariances with varEstToCov.

Testing

Of the common hypothesis tests for joint parameter testing, only the Wald test is widely used with plausible values and sample weights. As such, it replaces, if imperfectly, the Akaike Information Criteria (AIC), the likelihood ratio test, chi-squared, and analysis of variance (ANOVA, including *F*-tests). See waldTest or the vignette titled *Methods and Overview of Using EdSurvey for Running Wald Tests*.

hasPlausibleValue   *Plausible Value Test*

Description

Returns a value indicating if this variable has associated plausible values in an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
hasPlausibleValue(var, data)
```

Arguments

var	a character indicating the variable in question
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

Details

This function returns TRUE only when the variable passed to it is the name for a set of plausible values but not if it is an individual plausible value from such a set. Thus, on the NAEP Primer, composite has plausible values (and so TRUE would be returned by this function), but any of the plausible values or variable names defined in the actual data (such as "mrpcm1" or "dsex") are not.

Value

a Boolean (or vector when var is a vector) indicating if each element of var has plausible values associated with it

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))

# TRUE
hasPlausibleValue(var="composite", data=sdf)

# FALSE
hasPlausibleValue(var="dsex", data=sdf)

## End(Not run)
```

---

isWeight   *Weight Test*

Description

Returns logical values indicating whether a vector of variables is a weight for an edsurvey.data.frame,
a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
isWeight(var, data)
```

Arguments

var	a character vector of variables
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

Details

Note that this function returns TRUE only when the var element is the name of the weight used for
making estimates but not if it is one of the individual jackknife replicates.

Value

a logical vector of values indicating if each element of var is a weight

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))

# TRUE
isWeight(var="origwt", data=sdf)

# FALSE
isWeight(var="dsex", data=sdf)

## End(Not run)
```

---

levelsSDF   *Print Levels and Labels*

Description

Retrieve the levels and labels of a variable from an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
levelsSDF(varnames, data, showOmitted = TRUE, showN = TRUE)
```

Arguments

varnames	a vector of character strings to search for in the database connection object (data)
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
showOmitted	a Boolean indicating if omitted levels should be shown
showN	a Boolean indicating if (unweighted) *n*-sizes should be shown for each response level

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))

# search variables in the sdf
levelsSDF(varnames="pared", data=sdf)

# search multiple variables
```

```
levelsSDF(varnames=c("pared","ell3"), data=sdf)

# search multiple variables in a light.edsurvey.data.frame with recodes
df2 <- getData(data=sdf, varnames=c("dsex", "t088301"),
               recode=list(t088301=list(from=c("Yes, available","Yes, I have access"),
                                        to=c("Yes")),
                           t088301=list(from=c("No, have no access"),
                                        to=c("No"))),
               addAttributes=TRUE)
levelsSDF(varnames=c("dsex","t088301"), data=df2)

## End(Not run)
```

---

lm.sdf   *EdSurvey Linear Models*

Description

Fits a linear model that uses weights and variance estimates appropriate for the data.

Usage

```
lm.sdf(formula, data, weightVar = NULL, relevels = list(),
               varMethod = c("jackknife", "Taylor"), jrrIMax = 1,
               dropOmittedLevels = TRUE, defaultConditions = TRUE, recode = NULL,
               returnVarEstInputs = FALSE, returnNumberOfPSU = FALSE,
               standardizeWithSamplingVar = FALSE, verbose=TRUE,
               omittedLevels = deprecated())
```

Arguments

formula	a formula for the linear model. See lm. If *y* is left blank, the default subject scale or subscale variable will be used. (You can find the default using [showPlausibleValues](#).) If *y* is a variable for a subject scale or subscale (one of the names shown by [showPlausibleValues](#)), then that subject scale or subscale is used.
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
weightVar	a character indicating the weight variable to use (see Details). The weightVar must be one of the weights for the edsurvey.data.frame. If NULL, it uses the default for the edsurvey.data.frame.
relevels	a list. Used to change the contrasts from the default treatment contrasts to the treatment contrasts with a chosen omitted group (the reference group). The name of each element should be the variable name, and the value should be the group to be omitted (the reference group).
varMethod	a character set to "jackknife" or "Taylor" that indicates the variance estimation method to be used. See Details.

jrrIMax   a numeric value; when using the jackknife variance estimation method, the de-
                 fault estimation option, jrrIMax=1, uses the sampling variance from the first
                 plausible value as the component for sampling variance estimation. The Vjrr
                 term (see *Statistical Methods Used in EdSurvey*) can be estimated with any num-
                 ber of plausible values, and values larger than the number of plausible values on
                 the survey (including Inf) will result in all plausible values being used. Higher
                 values of jrrIMax lead to longer computing times and more accurate variance
                 estimates.

dropOmittedLevels
                 a logical value. When set to the default value of TRUE, drops those levels of all
                 factor variables that are specified in an edsurvey.data.frame. Use print on
                 an edsurvey.data.frame to see the omitted levels.

defaultConditions
                 a logical value. When set to the default value of TRUE, uses the default condi-
                 tions stored in an edsurvey.data.frame to subset the data. Use print on an
                 edsurvey.data.frame to see the default conditions.

recode   a list of lists to recode variables. Defaults to NULL. Can be set as recode=list(var1
                 = list(from= c("a", "b", "c"), to= "d")). See Examples.

returnVarEstInputs
                 a logical value set to TRUE to return the inputs to the jackknife and imputation
                 variance estimates, which allow for the computation of covariances between
                 estimates.

returnNumberOfPSU
                 a logical value set to TRUE to return the number of primary sampling units
                 (PSUs)

standardizeWithSamplingVar
                 a logical value indicating if the standardized coefficients should have the vari-
                 ance of the regressors and outcome measured with sampling variance. Defaults
                 to FALSE.

verbose   logical; indicates whether a detailed printout should display during execution

omittedLevels   this argument is deprecated. Use dropOmittedLevels

Details

This function implements an estimator that correctly handles left-hand side variables that are either
numeric or plausible values and allows for survey sampling weights and estimates variances using
the jackknife replication method. The vignette titled *Statistical Methods Used in EdSurvey* describes
estimation of the reported statistics.

Regardless of the variance estimation, the coefficients are estimated using the sample weights ac-
cording to the sections "Estimation of Weighted Means When Plausible Values Are Not Present"
or "Estimation of Weighted Means When Plausible Values Are Present," depending on if there are
assessment variables or variables with plausible values in them.

How the standard errors of the coefficients are estimated depends on the value of varMethod and the
presence of plausible values (assessment variables), But once it is obtained, the *t* statistic is given
by

$$t = \frac{\hat{\beta}}{\sqrt{\mathrm{var}(\hat{\beta})}}$$

where $\hat{\beta}$ is the estimated coefficient and $\mathrm{var}(\hat{\beta})$ is the variance of that estimate.

The **coefficient of determination (*R*-squared value)** is similarly estimated by finding the average *R*-squared using the average across the plausible values.

Standardized regression coefficients: Standardized regression coefficients can be returned in a call to summary, by setting the argument src to TRUE. See Examples.

By default, the standardized coefficients are calculated using standard deviations of the variables themselves, including averaging the standard deviation across any plausible values. When standardizeWithSamplingVar is set to TRUE, the variance of the standardized coefficient is calculated similar to a regression coefficient and therefore includes the sampling variance in the variance estimate of the outcome variable.

Variance estimation of coefficients: All variance estimation methods are shown in the vignette titled *Statistical Methods Used in EdSurvey*. When varMethod is set to the jackknife and the predicted value does not have plausible values, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Not Present, Using the Jackknife Method."

When plausible values are present and varMethod is jackknife, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Jackknife Method."

When plausible values are not present and varMethod is Taylor, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Not Present, Using the Taylor Series Method."

When plausible values are present and varMethod is Taylor, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Taylor Series Method."

Value

An edsurvey.lm with the following elements:

call	the function call
formula	the formula used to fit the model
coef	the estimates of the coefficients
se	the standard error estimates of the coefficients
Vimp	the estimated variance from uncertainty in the scores (plausible value variables)
Vjrr	the estimated variance from sampling
M	the number of plausible values
varm	the variance estimates under the various plausible values
coefm	the values of the coefficients under the various plausible values
coefmat	the coefficient matrix (typically produced by the summary of a model)
r.squared	the coefficient of determination
weight	the name of the weight variable
npv	the number of plausible values

jrrIMax	the jrrIMax value used in computation
njk	the number of the jackknife replicates used; set to NA when Taylor series variance estimates are used
varMethod	one of Taylor series or the jackknife
residuals	residuals from the average regression coefficients
PV.residuals	residuals from the by plausible value coefficients
PV.fitted.values	
	fitted values from the by plausible value coefficients
B	imputation variance covariance matrix, before multiplication by (M+1)/M
U	sampling variance covariance matrix
rbar	average relative increase in variance; see van Buuren (2012, eq. 2.29)
nPSU	number of PSUs used in calculation
n0	number of rows on an edsurvey.data.frame before any conditions were applied
nUsed	number of observations with valid data and weights larger than zero
data	data used for the computation
Xstdev	standard deviations of regressors, used for computing standardized regression coefficients when standardizeWithSamplingVar is set to FALSE (the default)
varSummary	the result of running summary2 (unweighted) on each variable in the regression
varEstInputs	when returnVarEstInputs is TRUE, this element is returned. These are used for calculating covariances with varEstToCov.
standardizeWithSamplingVar	
	when standardizeWithSamplingVar is set to TRUE, this element is returned. Calculates the standard deviation of the standardized regression coefficients like any other variable.

Testing

Of the common hypothesis tests for joint parameter testing, only the Wald test is widely used with plausible values and sample weights. As such, it replaces, if imperfectly, the Akaike Information Criteria (AIC), the likelihood ratio test, chi-squared, and analysis of variance (ANOVA, including *F*-tests). See waldTest or the vignette titled *Methods and Overview of Using EdSurvey for Running Wald Tests*.

merge.edsurvey.data   *EdSurvey Merge*

Description

Takes a `data.frame` or a `light.edsurvey.data.frame` and merges with a `edsurvey.data.frame` into it's internal data cache.

Usage

```
## S3 method for class 'edsurvey.data.frame'
merge(x, y, by = "id", by.x = by, by.y = by, ...)
```

Arguments

x	a edsurvey.data.frame. The x object is retained and has y values stored in the internal cache in memory. x also supports light.edusrvey.data.frame objects if y is a data.frame or light.edsurvey.data.frame object.
y	either a light.edsurvey.data.frame or a data.frame
by	the column name(s) to perform the data merge operation. If differing column names between the x and y objects, use the by.x and by.y arguments.
by.x	the column name(s) to perform the data merge operation for the x object. Defaults to by value.
by.y	the column name(s) to perform the data merge operation for the y object. Defaults to by value.
...	arguments passed to merge, note that all.x will always be TRUE (the data on the edsurvey.data.frame will always be kept) and all.y will always be FALSE to avoid adding data not on the edsurvey.data.frame.

Value

a merged data set the same object type as x. For edsurvey.data.frame objects then resulting merged data is stored in the objects internal data cache.

merge

Examples

```
## Not run:
# read in NAEP primer data
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))
lsdf <- getData(data=sdf, varnames=c("dsex", "b017451"), addAttributes = TRUE)
df <- data.frame(dsex = c("Male","Female"), dsex2 = c("Boy","Girl"))

#merging an edsurvey.data.frame with a data.frame/light.edsurvey.data.frame
#returns an edsurvey.data.frame object
sdf2 <- merge(sdf, df, by = "dsex")
table(sdf2$dsex2)

# merging a light.edsurvey.data.frame with a data.frame
# returns a light.edsurvey.data.frame object
merged_lsdf <- merge(lsdf,df, by = "dsex")
```

```
class(merged_lsdf) #  "light.edsurvey.data.frame" "data.frame"
head(merged_lsdf) # shows merge results

# merging behaves similarly to base::merge
df2 <- data.frame(dsex = c("Male","Female"), b017451 = c(1,2))
merged_lsdf2 <- merge(lsdf,df2, by = "dsex")
names(merged_lsdf2) # "dsex"       "b017451.x" "b017451.y"
head(merged_lsdf2) # shows merge results

## End(Not run)
```

---

mergev   *mergev*

Description

More verbose merge function

Usage

```
mergev(
  x,
  y,
  by = NULL,
  by.x = NULL,
  by.y = NULL,
  all.x = NULL,
  all.y = NULL,
  all = FALSE,
  order = c("sort", "unsorted", "x", "y"),
  fast = FALSE,
  merge.type.colname = "merge.type",
  return.list = FALSE,
  verbose = TRUE,
  showWarnings = TRUE,
  ...
)
```

Arguments

x	first data.frame to merge, same as in [merge](#).
y	second data.frame to merge, same as in [merge](#).
by	character vector of column names to merge by. When by is used, the column names must be the same in x and y. Silently overrides by.x and by.y
by.x	character vector of column names on x to merge by. The resulting file will have these names.
by.y	character vector of column names on y to merge by.

all.x   logical value indicating if unmerged rows from x should be included in the output.

all.y   logical value indicating if unmerged rows from y should be included in the output.

all   logical value indicating if unmerged rows from x and y should be included in the output. Silently overrides all.x and all.y.

order   character string from "sort", "unsorted", "x", and "y". Specifies the order of the output. Setting this to "sort" gives the same result as [merge](#) with sort=TRUE. unsorted gives the same result as sort=FALSE. "x" and "y" sort by the incoming sort order of x and y, respectively.

fast   logical value indicating if data.table should be used to do the merge.

merge.type.colname

                character indicating the column name of the resulting merge type column. See description.

return.list   logical value indicating if the merged data.frame and verbose output should be returned as elements of a list. Defaults to FALSE where the function simply returns a data.frame.

verbose   logical value indicating if output should be reported. Defaults to TRUE. Useful for testing.

showWarnings   logical value to output warning messages (TRUE) or suppress (FALSE). Defaults to TRUE.

...   additional parameters passed to merge.

Details

This is a wrapper for the base package merge function that prints out verbose information about the merge, including the merge type (one/many to one/many), the overlapping column names that will have suffixes applied, the number of rows and the number of unique keys that are in each dataset and in the resulting dataset.

Also gives more detailed errors when, e.g. the columns named in the by argument are not on the x or y data.frames.

Value

depends on the value of return.list.

When return.list is FALSE, returns a data.frame.

When return.list is TRUE, returns a list with two elements. The first is the same data.frame result. The second is a list with the values that were printed out. Elements include merge.type with two elements, each "one" or "many" indicating the merge type for x and y, respectively; inBoth, the list of column names in both merged data.frames; and merge.matrix the matrix printed out by this function.

mixed.sdf *EdSurvey Mixed-Effects Model*

Description

Fits a linear weighted mixed-effects model.

Usage

```
mixed.sdf(
  formula,
  data,
  weightVars = NULL,
  weightTransformation = TRUE,
  recode = NULL,
  defaultConditions = TRUE,
  tolerance = 0.01,
  nQuad = NULL,
  verbose = 0,
  family = NULL,
  centerGroup = NULL,
  centerGrand = NULL,
  fast = FALSE,
  ...
)
```

Arguments

formula
: a `formula` for the multilevel regression or mixed model. See Examples and the vignette titled *Methods Used for Estimating Mixed-Effects Models in EdSurvey* for more details on how to specify a mixed model. If *y* is left blank, the default subject scale or subscale variable will be used. (You can find the default using `showPlausibleValues`.) If *y* is a variable for a subject scale or subscale (one of the names shown by `showPlausibleValues`), then that subject scale or subscale is used.

data
: an `edsurvey.data.frame` or a `light.edsurvey.data.frame`

weightVars
: character vector indicating weight variables for corresponding levels to use. The `weightVar` must be the weights for the `edsurvey.data.frame`. The weight variables must be in the order of level (from lowest to highest level).

weightTransformation
: a logical value to indicate whether the function should standardize weights before using it in the multilevel model. If set to `TRUE`, the function will look up standard weight transformation methods often used for a specific survey. Weight transformation can be found in the vignette titled *Methods Used for Estimating Mixed-Effects Models in EdSurvey*. If set to `FALSE` or if the survey of the specified `data` does not have a standard weight transformation method, raw weights will be used.

recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode=list(var1 = list(from= c("a", "b", "c"), to= "d")). See Examples in lm.sdf.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
tolerance	depreciated, no effect
nQuad	depreciated, no effect
verbose	an integer; when set to 1, it will print out the brief progress of the function mix.sdf. Users can use these traced messages for further diagnosis. When set to 2, it will print out the detailed progress, including temporary estimates during the optimization. Defaults to 0, which will run the function without output.
family	this argument is depreciated; please use the WeMix package's mix function directly for binomial models.
centerGroup	a list in which the name of each element is the name of the aggregation level, and the element is a formula of variable names to be group mean centered. For example, to group mean center gender and age within the group student: list("student"= ~gender+age). Defaults to NULL, which means predictors are not adjusted by group centering. See Examples in the WeMix function mix.
centerGrand	a formula of variable names to be grand mean centered. For example, to center the variable education by overall mean of education: ~education. Defaults to NULL, which means predictors are not adjusted by grand centering.
fast	depreciated, no effect
...	other potential arguments to be used in mix

Details

This function uses the mix call in the WeMix package to fit mixed models. When the outcome does not have plausible values, the variance estimator directly from the mix function is used; these account for covariance at the top level of the model specified by the user.

When the outcome has plausible values, the coefficients are estimated in the same way as in lm.sdf, that is, averaged across the plausible values. In addition, the variance of the coefficients is estimated as the sum of the variance estimate from the mix function and the imputation variance. The formula for the imputation variance is, again, the same as for lm.sdf, with the same estimators as in the vignette titled *Statistical Methods Used in EdSurvey*. In the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Jackknife Method" in the formula for V_{imp}, the variance and estimates of the variance components are estimated with the same formulas as the regression coefficients.

Value

A mixedSdfResults object with the following elements:

call	the original call used in mixed.sdf
formula	the formula used to fit the model
coef	a vector of coefficient estimates

se	a vector with the standard error estimates of the coefficients and the standard error of the variance components
vars	estimated variance components of the model
levels	the number of levels in the model
ICC	the intraclass correlation coefficient of the model
npv	the number of plausible values
ngroups	a data.frame that includes the number of observations for each group
n0	the number of observations in the original data
nused	the number of observations used in the analysis
model.frame	the data used in the model

If the formula does not involve plausible values, the function will return the following additional elements:

lnlf	the likelihood function
lnl	the log-likelihood of the model

If the formula involves plausible values, the function will return the following additional elements:

Vimp	the estimated variance from uncertainty in the scores
Vjrr	the estimated variance from sampling

mml.sdf   *EdSurvey Direct Estimation*

Description

Prepare IRT parameters and score items and then estimate a linear model with direct estimation.

Usage

```
mml.sdf(
  formula,
  data,
  weightVar = NULL,
  dropOmittedLevels = TRUE,
  composite = TRUE,
  verbose = 0,
  multiCore = FALSE,
  numberOfCores = NULL,
  minNode = -4,
  maxNode = 4,
  Q = 34,
  idVar = NULL,
  returnMmlCall = FALSE,
  omittedLevels = deprecated()
)
```

Arguments

formula	a `formula` for the model.
data	an `edsurvey.data.frame` for the National Assessment of Educational Progress (NAEP) and the Trends in International Mathematics and Science Study (TIMSS). The attributes `dichotParamTab`, `polyParamTab`, `testData`, `scoreCard` (for NAEP), and `scoreDict` (for TIMSS) must not be NULL. Use the function `setNAEPScoreCard` or `setAttributes` to set attributes.
weightVar	a character indicating the weight variable to use. The `weightVar` must be one of the weights for the `edsurvey.data.frame`. If NULL, it uses the default for the `edsurvey.data.frame`.
dropOmittedLevels	
	a logical value. When set to the value of TRUE, drops the levels of all factor variables that are specified in an `edsurvey.data.frame`. Use `print` on an `edsurvey.data.frame` to see the omitted levels. To draw plausible values for the full dataset, the user must set this to FALSE.
composite	logical; for a NAEP composite, setting to FALSE fits the model to all items at once, in a single construct, whereas setting to TRUE fits the model as a NAEP composite (i.e., a weighted average of the subscales). This argument is not applicable for TIMSS which is always fit as an overall (non-composite).

verbose	logical; indicates whether a detailed printout should display during execution, only for NAEP data.
multiCore	allows the foreach package to be used. This function will setup and take down the cluster.
numberOfCores	the number of cores to be used when using multiCore. Defaults to 75% of available cores. Users can check available cores with detectCores().
minNode	numeric; minimum integration point in direct estimation; see mml.
maxNode	numeric; maximum integration point in direct estimation; see mml.
Q	integer; number of integration points per student used when integrating over the levels of the latent outcome construct.
idVar	a variable that is used to explicitly define the name of the student identifier variable to be used from data. Defaults to NULL, and sid is used as the student identifier.
returnMmlCall	logical; when TRUE, do not process the mml call but instead return it for the user to edit before calling
omittedLevels	this argument is deprecated. Use dropOmittedLevels

Details

Typically, models are fit with NAEP data using plausible values to integrate out the uncertainty in the measurement of individual student outcomes. When direct estimation is used, the measurement error is integrated out explicitly using Q quadrature points. See documentation for mml in the Dire package.

The scoreDict helps turn response categories that are not simple item responses, such as Not Reached and Multiple, to something coded as inputs for the mml function in Dire. How mml treats these values depends on the test. For NAEP, for a dichotomous item, 8 is scored as the same proportion correct as the guessing parameter for that item, 0 is an incorrect response, an NA does not change the student's score, and 1 is correct. TIMSS does not require a scoreDict.

Value

An mml.sdf object, which is the outcome from mml.sdf, with the following elements:

mml	an object containing information from the mml procedure. ?mml can be used for further information.
scoreDict	the scoring used in the mml procedure
.	
itemMapping	the item mapping used in the mml procedure
.

mvrlm.sdf   *Multivariate Regression*

Description

Fits a multivariate linear model that uses weights and variance estimates appropriate for the edsurvey.data.frame.

Usage

```
mvrlm.sdf(
  formula,
  data,
  weightVar = NULL,
  relevels = list(),
  jrrIMax = 1,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  returnVarEstInputs = FALSE,
  estMethod = "OLS",
  verbose = TRUE,
  omittedLevels = deprecated()
)
```

Arguments

formula	a Formula package Formula for the linear model. See Formula; left-hand side variables are separated with vertical pipes (|). See Examples.
data	an edsurvey.data.frame or an edsurvey.data.frame.list
weightVar	character indicating the weight variable to use (see Details). The weightVar must be one of the weights for the edsurvey.data.frame. If NULL, uses the default for the edsurvey.data.frame.
relevels	a list. Used to change the contrasts from the default treatment contrasts to treatment contrasts with a chosen omitted group (the reference group). To do this, the user puts an element on the list with the same name as a variable to change contrasts on and then make the value for that list element equal to the value that should be the omitted group (the reference group).
jrrIMax	a numeric value; when using the jackknife variance estimation method, the default estimation option, jrrIMax=1, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The V_{jrr} term (see *Statistical Methods Used in EdSurvey*) can be estimated with any number of plausible values, and values larger than the number of plausible values on the survey (including Inf) will result in all plausible values being used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.
dropOmittedLevels	
	a logical value. When set to the default value of TRUE, drops those levels of all factor variables that are specified in edsurvey.data.frame. Use print on an edsurvey.data.frame to see the omitted levels.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode = list(var1= list(from=c("a","b","c"), to ="d")).

returnVarEstInputs

> a logical value. Set to TRUE to return the inputs to the jackknife and imputation variance estimates, which allow for computation of covariances between estimates.

estMethod   a character value indicating which estimation method to use. Default is OLS; other option is GLS.

verbose   logical; indicates whether a detailed printout should display during execution

omittedLevels   this argument is deprecated. Use dropOmittedLevels

Details

This function implements an estimator that correctly handles multiple left-hand side variables that are either numeric or plausible values, allows for survey sampling weights, and estimates variances using the jackknife replication method. The vignette titled *Statistical Methods Used in EdSurvey* describes estimation of the reported statistics.

The **coefficients** are estimated using the sample weights according to the section "Estimation of Weighted Means When Plausible Values Are Not Present" or the section "Estimation of Weighted Means When Plausible Values Are Present," depending on if there are assessment variables or variables with plausible values in them.

The **coefficient of determination (R-squared value)** is similarly estimated by finding the average R-squared using the sample weights for each set of plausible values.

> **Variance estimation of coefficients:** All variance estimation methods are shown in the vignette titled *Statistical Methods Used in EdSurvey*.
>
> When the predicted value does not have plausible values, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Not Present, Using the Jackknife Method."
>
> When plausible values are present, the variance of the coefficients is estimated according to the section "Estimation of Standard Errors of Weighted Means When Plausible Values Are Present, Using the Jackknife Method."

For more information on the specifics of multivariate regression, see the vignette titled Methods and Overview of Using EdSurvey for Multivariate Regression.

Value

An edsurvey.mvrlm with elements:

call   the function call

formula   the formula used to fit the model

coef   the estimates of the coefficients

se   the standard error estimates of the coefficients

Vimp   the estimated variance caused by uncertainty in the scores (plausible value variables)

Vjrr   the estimated variance caused by sampling

M   the number of plausible values

varm	the variance estimates under the various plausible values
coefm	the values of the coefficients under the various plausible values
coefmat	the coefficient matrix (typically produced by the summary of a model)
r.squared	the coefficient of determination
weight	the name of the weight variable
npv	the number of plausible values
njk	the number of the jackknife replicates used
varEstInputs	When returnVarEstInputs is TRUE, this element is returned. These are used for calculating covariances with varEstToCov.
residuals	residuals for each of the PV models
fitted.values	model fitted values
residCov	residual covariance matrix for dependent variables
residPV	residuals for each dependent variable
inputs	coefficient estimation input matrices
n0	full data n
nUsed	n used for model
B	imputation variance-covariance matrix, before multiplication by (M+1)/M
U	sampling variance-covariance matrix

oddsRatio   *Odds Ratios for edsurveyGlm Models*

Description

Converts coefficients from edsurveyGlm logit regression model to odds ratios.

Usage

```
oddsRatio(model, alpha = 0.05)
```

Arguments

model   an edsurveyGlm model

alpha   the alpha level for the confidence level

Value

An `oddsRatio.edsurveyGlm` object with the following elements:

OR   odds ratio coefficient estimates

2.5%   lower bound 95% confidence interval

97.5%   upper bound 95% confidence interval

---

parseNAEPdct   *Format AM dct File for Use with DirectEstimation*

Description

Takes an `AM` `dct` file and formats it for use with the `mml` method as `paramTab`.

Usage

```
parseNAEPdct(dct, mml = TRUE)
```

Arguments

dct   a file location from which to read the `dct` file

mml   a logical for if the paramTab is being used in `mml.sdf`

Value

a `data.frame` in a format suitable for use with `mml` as a `paramTab`.

Author(s)

Sun-Joo Lee

---

parseScript_SPSS   *Parse SPSS Syntax Script for Fixed-Width Data Files*

Description

Parses an SPSS Syntax Script (.sps) file to return information relating to fixed-width data files.

Usage

```
parseScript_SPSS(
  spsFilePath,
  verbose = FALSE,
  outputFormat = c("data.frame"),
  encoding = getOption("encoding")
)
```

Arguments

`spsFilePath`	a character value of the file path to the SPSS script to parse.
`verbose`	a logic value to indicate if user wishes to print parsing activity to console. Default value is `FALSE`.
`outputFormat`	a named argument to indicate which output format the resulting object should be. See details for information on each format. Currently, `data.frame` format is only supported.
`encoding`	a character value to indicate the encoding specification that is used by `readLines` base function for the `spsFilePath` parameter. Only adjust this parameter if the original file encoding of the file is known, is not producing correct string values, or other errors occur. See `?readLines` help for details about it's use for file encoding, and additional details.

Details

NOT CURRENTLY EXPORTED! In Future this could potentially be made to a separate R package THIS parseScript_SPSS function should be used 100 Old/Previous SPSS script parsers should be slowly transitioned to utilize this function when possible to maximize code use.

The SPSS syntax script parser is focused on gathering details for use with fixed-width data files. This function scans for the following SPSS commands:

- FILE HANDLE
- DATA LIST
- VARIABLE LABEL
- VALUE LABEL
- MISSING VALUE

The `outputFormat` specified will determine the result object returned. This function currently supports the following formats.

- data.frame
  - variableName - The variable name as defined in the script
  - Start - The start number index of the variable defined for the fixed-width format layout
  - End - The end number index of the variable defined for the fixed-width format layout
  - Width - The length of how many columns the variable uses in the fixed-width format layout
  - Attributes - Any SPSS attributes that are defined in the DATA LIST command. This is typically only for field formatting.
  - RecordNumber - Some fixed-width data files are considered "multi-line" where one record of data can span multiple rows in the file. The RecordNumber indicates which line the variable is assigned.
  - Labels - The descriptive label associated with the variable name to give more detail or context.

– labelValues - For categorical variables a stored value will typically be assigned a longer label/definition. This string identifies these mappings. The '^' symbol is used to delimit each individual label value. Then additionally, the '=' is used to split the value from the left side of the '=' symbol, and the remaining right-hand side of '=' is the text label for that value.

– dataType - A best-guess of the data type (either 'numeric' or 'character') without actually examining the data-file.

– missingValues - If a MISSING VALUE clause is included in the script this will list the values that are considered 'Missing'. If multiple values specified, they will be delimited by a ';' (semi-colon) symbol.

Value

returns an object containing information specified by the `outputFormat` argument.

Tom Fink

---

percentile	*EdSurvey Percentiles*

Description

Calculates the percentiles of a numeric variable in an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`.

Usage

```
percentile(
  variable,
  percentiles,
  data,
  weightVar = NULL,
  jrrIMax = 1,
  varMethod = c("jackknife", "Taylor"),
  alpha = 0.05,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  returnVarEstInputs = FALSE,
  returnNumberOfPSU = FALSE,
  pctMethod = c("symmetric", "unbiased", "simple"),
  confInt = TRUE,
  dofMethod = c("JR", "WS"),
  omittedLevels = deprecated()
)
```

Arguments

variable	the character name of the variable to percentiles computed, typically a subject scale or subscale
percentiles	a numeric vector of percentiles in the range of 0 to 100 (inclusive)
data	an edsurvey.data.frame or an edsurvey.data.frame.list
weightVar	a character indicating the weight variable to use.
jrrIMax	a numeric value; when using the jackknife variance estimation method, the default estimation option, jrrIMax=1, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The V_{jrr} term (see *Statistical Methods Used in EdSurvey*) can be estimated with any number of plausible values, and values larger than the number of plausible values on the survey (including Inf) will result in all plausible values being used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.
varMethod	a character set to jackknife or Taylor that indicates the variance estimation method used when constructing the confidence intervals. The jackknife variance estimation method is always used to calculate the standard error.
alpha	a numeric value between 0 and 1 indicating the confidence level. An alpha value of 0.05 would indicate a 95% confidence interval and is the default.
dropOmittedLevels	
	a logical value. When set to the default value of TRUE, drops those levels of all factor variables that are specified in achievementVars and aggregatBy. Use print on an edsurvey.data.frame to see the omitted levels.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode=list(var1= list(from= c("a", "b", "c"), to= "d")).
returnVarEstInputs	
	a logical value set to TRUE to return the inputs to the jackknife and imputation variance estimates which allows for the computation of covariances between estimates.
returnNumberOfPSU	
	a logical value set to TRUE to return the number of primary sampling units (PSUs)
pctMethod	one of "unbiased", "symmetric", "simple"; unbiased produces a weighted median unbiased percentile estimate, whereas simple uses a basic formula that matches previously published results. Symmetric uses a more basic formula but requires that the percentile is symetric to multiplying the quantity by negative one.
confInt	a Boolean indicating if the confidence interval should be returned
dofMethod	passed to [DoFCorrection](#) as the method argument
omittedLevels	this argument is deprecated. Use dropOmittedLevels

Details

Percentiles, their standard errors, and confidence intervals are calculated according to the vignette titled *Statistical Methods Used in EdSurvey*. The standard errors and confidence intervals are based on separate formulas and assumptions.

The Taylor series variance estimation procedure is not relevant to percentiles because percentiles are not continuously differentiable.

Value

The return type depends on whether the class of the data argument is an edsurvey.data.frame or an edsurvey.data.frame.list.

The data argument is an edsurvey.data.frame When the data argument is an edsurvey.data.frame, percentile returns an S3 object of class percentile. This is a data.frame with typical attributes (names, row.names, and class) and additional attributes as follows:

n0	number of rows on edsurvey.data.frame before any conditions were applied
nUsed	number of observations with valid data and weights larger than zero
nPSU	number of PSUs used in the calculation
call	the call used to generate these results

The columns of the data.frame are as follows:

percentile	the percentile of this row
estimate	the estimated value of the percentile
se	the jackknife standard error of the estimated percentile
df	degrees of freedom
confInt.ci_lower	
	the lower bound of the confidence interval
confInt.ci_upper	
	the upper bound of the confidence interval
nsmall	the number of units with more extreme results, averaged across plausible values

When the confInt argument is set to FALSE, the confidence intervals are not returned.

The data argument is an edsurvey.data.frame.list When the data argument is an edsurvey.data.frame.list, percentile returns an S3 object of class percentileList. This is a data.frame with a call attribute. The columns in the data.frame are identical to those in the previous section, but there also are columns from the edsurvey.data.frame.list.

covs	a column for each column in the covs value of the edsurvey.data.frame.list. See Examples.

When returnVarEstInputs is TRUE, an attribute varEstInputs also is returned that includes the variance estimate inputs used for calculating covariances with varEstToCov.

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# get the median of the composite
percentile(variable="composite", percentiles=50, data=sdf)

# get several percentiles
percentile(variable="composite", percentiles=c(0,1,25,50,75,99,100), data=sdf)
# build an edsurvey.data.frame.list
sdfA <- subset(sdf, scrpsu %in% c(5,45,56))
sdfB <- subset(sdf, scrpsu %in% c(75,76,78))
sdfC <- subset(sdf, scrpsu %in% 100:200)
sdfD <- subset(sdf, scrpsu %in% 201:300)

sdfl <- edsurvey.data.frame.list(datalist=list(sdfA, sdfB, sdfC, sdfD),
                                 labels=c("A locations",
                                          "B locations",
                                          "C locations",
                                          "D locations"))
# this shows how these datasets will be described:
sdfl$covs

percentile(variable="composite", percentiles=50, data=sdfl)
percentile(variable="composite", percentiles=c(25, 50, 75), data=sdfl)

## End(Not run)
```

---

print.achievementLevels

Print AchievementLevels Results

Description

Prints details of discrete and cumulative achievement levels calculated using weights and variance estimates appropriate for the edsurvey.data.frame.

Usage

```
## S3 method for class 'achievementLevels'
print(
  x,
  printCall = TRUE,
```

```
  printDiscrete = TRUE,
  printCumulative = TRUE,
  use_es_round = getOption("EdSurvey_round_output"),
  ...
)
```

Arguments

x	an `achievementLevels` object
printCall	a logical value; by default (TRUE), prints details about plausible values and weights used for calculating achievement levels
printDiscrete	a logical value; by default (TRUE), prints discrete achievement levels if they are present in `x`
printCumulative	
	a logical value; by default (TRUE), prints cumulative achievement levels if they are present in `x`
use_es_round	a logical value; use the EdSurvey rounding functions before printing
...	these arguments are not passed anywhere and are included only for compatibility

print.edsurvey.data.frame

EdSurvey Metadata Summary

Description

Prints metadata regarding an `edsurvey.data.frame` or an `edsurvey.data.frame.list`

Usage

```
## S3 method for class 'edsurvey.data.frame'
print(
  x,
  printColnames = FALSE,
  use_es_round = getOption("EdSurvey_round_output"),
  round_n = getOption("EdSurvey_round_n_function"),
  ...
)
```

Arguments

x	an edsurvey.data.frame or an edsurvey.data.frame.list
printColnames	a logical value; set to TRUE to see all column names in the edsurvey.data.frame or the edsurvey.data.frame.list
use_es_round	a logical; round the output per es_round function
round_n	function used to round sample n-sizes. See es_round
...	these arguments are not passed anywhere and are included only for compatibility

Michael Lee and Paul Bailey

---

print.gap   *Gap Analysis Printing*

Description

Prints labels and a results vector of a gap analysis.

Usage

```
## S3 method for class 'gap'
print(
  x,
  ...,
  printPercentage = TRUE,
  use_es_round = getOption("EdSurvey_round_output")
)

## S3 method for class 'gapList'
print(x, ..., printPercentage = TRUE)
```

Arguments

x	an R object representing a gap of class gap or gapList
...	these arguments are not passed anywhere and are included only for compatibility
printPercentage	a logical value set to TRUE to request printing of the percentage in the groups. Defaults to TRUE.
use_es_round	use the EdSurvey rounding methods for gap

Paul Bailey

---

readBTLS *Connect to BTLS Data*

Description

Opens a connection to the Beginning Teacher Longitudinal Study (BTLS) waves 1 through 5 data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readBTLS(dat_FilePath, spss_FilePath, verbose = TRUE)
```

Arguments

dat_FilePath	a character value to the full path of the BTLS fixed-width (.dat) data file
spss_FilePath	a character value to the full path of the SPSS syntax file to process the dat_FilePath
verbose	a logical value that will determine if you want verbose output while the readBTLS function is running to indicate processing progress (the default value is TRUE)

Details

Reads the spss_FilePath file to parse the dat_FilePath to an edsurvey.data.frame. There is no cached data because the dat_FilePath format already is in fixed-width format.

Value

an edsurvey.data.frame for the BTLS waves 1 to 5 longitudinal dataset.

Author(s)

Tom Fink

Examples

```
## Not run:

fld <- "~/EdSurveyData/BTLS"
datPath <- file.path(fld, "ASCII Data File", "BTLS2011_12.dat")
spsPath <- file.path(fld, "Input Syntax for Stata and SPSS", "BTLS2011_12.sps")

#read in the data to an edsurvey.data.frame
btls <- readBTLS(datPath, spsPath, verbose = TRUE)

dim(btls)

## End(Not run)
```

---

readCivEDICCS   *Connect to ICCS and CivED Data*

Description

Opens a connection to an ICCS (2009, 2016) or CivEd (1999) data file and returns an `edsurvey.data.frame` with information about the file and data.

Usage

```
readCivEDICCS(
  path,
  countries,
  dataSet = c("student", "teacher"),
  gradeLvl = c("8", "9", "12"),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path	a character value of the full directory to the ICCS/CivED extracted SPSS (.sav) set of data
countries	a character vector of the country/countries to include using the three-digit International Organization for Standardization (ISO) country code. A list of country codes can be found on Wikipedia at `https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes` or other online sources. Consult the *ICCS/CivED User Guide* to help determine what countries are included within a specific testing year of ICCS/CivED. To select all countries, use a wildcard value of `*`.
dataSet	a character value of either `student` or `teacher` to indicate which set of data is returned. The student-level and teacher-level datasets cannot both be returned at the same time, unlike other IEA datasets. Note: The CivED 1999 study also included student-to-teacher data for Grade 8. Specifying `dataSet="student"` and `gradeLvl=8` will include both the `student` and `teacher` data in the resulting `edsurvey.data.frame`.
gradeLvl	a character value of the grade level to return • **8** = eighth grade (the default if not specified) • **9** = ninth grade • **12** = 12th grade (for CivED 1999 only)
forceReread	a logical value to force rereading of all processed data. The default value of `FALSE` will speed up the `readCivEDICCS` function by using existing read-in data already processed.
verbose	a logical value to either print or suppress status message output. The default value is `TRUE`.

Details

Reads in the unzipped files downloaded from the international database(s) using the IEA Study Data Repository. Data files require the SPSS data file (.sav) format using the default filenames.

When using the getData function with a CivED or ICCS study edsurvey.data.frame, the requested data variables are inspected, and it handles any necessary data merges automatically. The school data always will be returned merged to the student data, even if only school variables are requested. If a 1999 CivED Grade 8 edsurvey.data.frame with teacher data variables is requested by the getData call, it will cause teacher data to be merged. Many students can be linked to many teachers, which varies widely between countries, and not all countries contain teacher data.

Calling the dim function for a CivED 1999 Grade 8 edsurvey.data.frame will result in the row count as if the teacher dataset was merged. This row count will be considered the full data N of the edsurvey.data.frame, even if no teacher data were included in an analysis. The column count returned by dim will be the count of unique column variables across all data levels.

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if multiple countries specified

Author(s)

Tom Fink

                     gradeLvl = 8, dataSet = "student")
gg <- getData(getData=eng, varnames=c("famstruc", "totwgts", "civ"))
head(gg)
edsurveyTable(formula=civ ~ famstruc, data=eng)

## End(Not run)
```

---

readECLS_B   *Connect to ECLS-B Data*

Description

Opens a connection to an ECLS-B data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readECLS_B(
  path = getwd(),
  filename,
  layoutFilename,
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path	a character value to the full directory path(s) to the ECLS-B extracted fixed-with-format (.dat) set of datafiles.
filename	a character value of the name of the fixed-width-file (.dat) data file in the specificed `path` to be read.
layoutFilename	a character value of the filename of either the ASCII text (.txt) layout file of the `filename` within the specified `path`, OR a character value of the filename of the SPSS syntax (.sps) layout file of the `filename` within the specified `path`
forceReread	a logical value to force rereading of all processed data. The default value of `FALSE` will speed up the read function by using existing read-in data already processed.
verbose	a logical value that will determine if you want verbose output while the `readECLS-K2011` function is running to indicate processing progress. The default value is `TRUE`.

Details

Reads in the unzipped files downloaded from the ECLS-B longitudinal Database.

Value

An `edsurvey.data.frame` for the ECLS-B longitudinal dataset.

readECLS_K1998 *Connect to ECLS–K 1998 Data*

Description

Opens a connection to an ECLS–K 1998 data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readECLS_K1998(
  path = getwd(),
  filename = "eclsk_98_99_k8_child_v1_0.dat",
  layoutFilename = "Layout_k8_child.txt",
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path	a character value to the full directory path(s) to the ECLS–K-extracted fixed-width-format (.dat) set of data files
filename	a character value of the name of the fixed-width (.dat) data file in the specified path to be read
layoutFilename	a character value of the filename of either the ASCII (.txt) layout file of the filename within the specified path or a character value of the filename of the SPSS syntax (.sps) layout file of the filename within the specified path
forceReread	a logical value to force rereading of all processed data. The default value of FALSE will speed up the read function by using existing read-in data already processed.
verbose	a logical value that will determine if you want verbose output while the readECLS-K1998 function is running to indicate processing progress. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the ECLS–K 1998 longitudinal dataset(s) to an edsurvey.data.frame. The ECLS–K 1998–99 study consisted of three distinct separate datasets that cannot be combined: (1) Child Grades K–8 Data, (2) School Base-Year Data, and (3) Teacher Base-Year Data. The filename and layoutFilename arguments default to the corresponding Child K–8 default filenames.

Value

an edsurvey.data.frame for the ECLS–K 1998 longitudinal dataset

```

readELS *Connect to Education Longitudinal Study (ELS:2002) Data*

Description

Opens a connection to an ELS data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readELS(
  path = getwd(),
  filename = "els_02_12_byf3pststu_v1_0.sav",
  wgtFilename = ifelse(filename == "els_02_12_byf3pststu_v1_0.sav",
    "els_02_12_byf3stubrr_v1_0.sav", NA),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path	a character value to the directory path of the extracted set of data files and layout files.
filename	a character value of the name of the SPSS (.sav) data file in the specified path to be read.
wgtFilename	a character value of the name of the associated balanced repeated replication (BRR) weight SPSS (.sav) data file in the specified path to be read. This argument is applicable only for the student-level data, which contains a separate data file containing the weight replicate information. If using default filenames (recommended), then you shouldn't need to specify this parameter because it will inspect the filename argument. For data files with no BRR weight file associated, specify a value of NULL or NA.
forceReread	a logical value to force rereading of all processed data. The default value of FALSE will speed up the read function by using existing read-in data already processed.
verbose	a logical value that will determine if you want verbose output while the readELS function is running to indicate processing progress. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the ELS longitudinal dataset(s) to an edsurvey.data.frame. The ELS 2002 study consisted of four distinct separate datasets that cannot be combined:

- Student: bas -year through follow-up three (default)
- School: base year through follow-up one
- Institution: follow-up two
- Institution: follow-up three

Value

an edsurvey.data.frame for the ELS longitudinal dataset

Author(s)

Tom Fink

                      forceReread = FALSE)

## End(Not run)
```

---

readHSB_Senior   *Connect to HS&B Study Senior Data*

Description

Opens a connection to a High School & Beyond 1980–1986 Senior cohort data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readHSB_Senior(
  HSR8086_PRI_FilePath,
  HSR8086_SASSyntax_Path,
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

HSR8086_PRI_FilePath

a character value to the main study-derived analytical data file (HSR8086_REV.PRI). Located within the REVISED_ASCII Folder.

HSR8086_SASSyntax_Path

a character value to the SAS syntax file for parsing the HSR8086_REV.PRI data file. Located within the SAS_EXTRACT_LOGIC Folder.

forceReread   a logical value to force rereading of all processed data. The default value of FALSE will speed up the read function by using existing read-in data already processed.

verbose   a logical value that will determine if you want verbose output while the readHSB_Senior function is running to indicate processing progress. The default value is TRUE.

Details

Reads in the specified HSR8086_SASSyntax_Path file to parse the HSR8086_PRI_FilePath file. A cached data file and metadata file will be saved in the same directory and filename as the HSR8086_PRI_FilePath file, having new file extensions of .txt and .meta, respectively.

Please note the original source repcode variable has been split into two variables named repcode_str for the stratum value and repcode_psu for the primary sampling unit (PSU) value in the resulting cache data.

Value

an edsurvey.data.frame for the HS&B Senior 1980–1986 longitudinal dataset

Author(s)

Tom Fink

readHSB_Sophomore   *Connect to HS&B Study Sophomore Data*

Description

Opens a connection to a High School & Beyond 1980–1992 Sophomore cohort data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readHSB_Sophomore(
  HSO8092_PRI_FilePath,
  HSO8092_SASSyntax_Path,
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

HSO8092_PRI_FilePath

> a character value to the main study-derived analytical data file (HSO8092_REV.PRI). Located within the REVISED_ASCII folder.

HSO8092_SASSyntax_Path

> a character value to the SAS syntax file for parsing the HSO8092_REV.PRI data file. Located within the SAS_EXTRACT_LOGIC folder.

forceReread   a logical value to force rereading of all processed data. The default value of FALSE will speed up the read function by using existing read-in data already processed.

verbose   a logical value that will determine if you want verbose output while the readHSB_Sophomore function is running to indicate processing progress. The default value is TRUE.

Details

Reads in the specified `HSO8092_SASSyntax_Path` file to parse the `HSO8092_PRI_FilePath` file. A cached data file and metadata file will be saved in the same directory and filename as the `HSO8092_PRI_FilePath` file, having new file extensions of .txt and .meta, respectively.

Please note the original source `repcode` variable has been split into two variables named `repcode_str` for the stratum value and `repcode_psu` for the primary sampling unit (PSU) value in the resulting cache data.

Value

an `edsurvey.data.frame` for the HS&B Sophomore 1980–1992 longitudinal dataset

Author(s)

Tom Fink

See Also

Examples

```
## Not run:
wrkFld <- "~/HSB/SOPHOMORE"

dataPath <- file.path(wrkFld, "REVISED_ASCII", "HSO8092_REV.PRI")
sasPath <- file.path(wrkFld, "SAS_EXTRACT_LOGIC", "HSBso_READ_HSO8092.SAS")

# with verbose output as default
hsbSO <- readHSB_Sophomore(dataPath, sasPath)

# silent output
hsbSO <- readHSB_Sophomore(dataPath, sasPath, verbose = FALSE)

# force cache update
hsbSO <- readHSB_Sophomore(dataPath, sasPath, forceReread = TRUE)

## End(Not run)
```

---

readHSLS   *Connect to High School Longitudinal Study 2009 (HSLS:2009) Data*

Description

Opens a connection to an HSLS data file and returns an `edsurvey.data.frame` with information about the file and data.

Usage

```
readHSLS(
  path = getwd(),
  filename = "hsls_16_student_v1_0.sav",
  wgtFilename = NA,
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path	a character value to the full directory path(s) to the HSLS extracted SPSS (.sav) set of data files
filename	a character value of the name of the SPSS (.sav) datafile to be read
wgtFilename	a character value of the name of the associated BRR weight SPSS (.sav) data file in the specified path to be read. This argument is only applicable for the restricted-use student level data, which contains a separate data-file containing the weight replicate information. For data files with no balanced repeated replication (BRR) weight file associated, specify a value of NULL or NA.
forceReread	a logic value to force a rereading of all processed data. The default value of FALSE speeds up the readHSLS function by using existing read-in data already processed.
verbose	a logical value set to TRUE for verbose output that indicates progress

Details

Reads in the unzipped files downloaded from the HSLS longitudinal dataset.

Value

an edsurvey.data.frame for the HSLS longitudinal dataset

Note

The SPSS (.sav) format is preferred over the fixed-width-format (.dat) ASCII file format at this time relating to value label issues identified with the ASCII layout specifications.

Examples

```
## Not run:
# use function default values at working directory
hsls <- readHSLS("~/HSLS/2009")

# specify parameters with verbose output
hsls <- readHSLS(path="~/HSLS/2009",
                 filename = "hsls_16_student_v1_0.sav",
                 forceReread = FALSE,
                 verbose = TRUE)

# specify parameters silent output
hsls <- readHSLS(path="~/HSLS/2009",
                 filename = "hsls_16_student_v1_0.sav",
                 forceReread = FALSE,
                 verbose = FALSE)

#for restricted-use student data, replicate weights stored in separate file
hslsRUD <- readHSLS(path="~/HSLS/2009",
                    filename = "hsls_16_student_v1_0.sav",
                    wgtFilename = "hsls_16_student_BRR_v1_0.sav",
                    forceReread = FALSE,
                    verbose = TRUE)

## End(Not run)
```

---

readHSTS   *Connect to HSTS Data*

Description

Opens a connection to a High School Transcript Study (HSTS) data files for years 2019. Returns an edsurvey.data.frame with information about the file and data.

Usage

```
readHSTS(
  dataFilePath = getwd(),
  spssPrgPath = dataFilePath,
  year = c("2019"),
  verbose = TRUE
)
```

Arguments

dataFilePath   a character value to the root directory path of extracted set of ASCII data files
                (.txt or .dat file extension). readHSTS will search within sub-directories of this
                parameter for expected data files based on the specified year parameter.

spssPrgPath	a character value to the directory path of where the extracted set of .sps program files are located. The data file and associated SPSS program filenames *must match* (having different file extensions) to determine which files are associated together. readHSTS will search within sub-directories of this parameter for expected SPSS programe files based on the specified year parameter.
year	a character value to indicate the year of the dataset. Only one year is supported for a single readHSTS data call. The year is required to help determine specific study information. Only 2019 study is currently supported.
verbose	a logical value that will determine if you want verbose output while the readHSTS function is running to indicate processing progress. The default value is TRUE.

Details

The HSTS data has a complex structure and unique characteristics all handled internally within EdSurvey. The structure allows for automatic dynamic linking across all various data 'levels' based the requested variables. The student data level is the primary analysis unit. Dynamic linking for variables that include both tests and transcript level details will result in an error, as they cannot be simultaneously returned in a single call. Situations may arise where the analyst must derive variables for analysis. See the documentation for merge and $<- functions for more detail. All merge operations are done at the student level (the main analysis unit).

File Layout for HSTS 2019:

- School (school.dat) - School level variables.
    - School Catalog (catalog.dat) - Catalog variables joined to School data. Variables renamed to begin with SchCat_ to distinguish from Transcript Catalog. Cannot be merged with any Student data.
- Student (student.dat) - Student level variables. Primary analysis unit, all merged/cached data must be at this level.
    - NAEP Math (naepmath.dat) - Subset of students containing NAEP Math variables. Variables begin with math_ to ensure they are unique from the NAEP Science variables.
    - NAEP Science (naepsci.dat) - Subset of students containing NAEP Science variables. Variables begin with sci_ to ensure they are unique from the NAEP Math variables.
    - Tests (tests.dat) - Students may have many test records. Contains ACT/SAT testing score details for students. Cannot be merged together with any Transcript or Transcript Catalog data.
    - Transcripts (trnscrpt.dat) - Students may have many transcript records. Contains transcript level details. Cannot be merged together with Test data.
        * Transcript Catalog (catalog.dat) - Each transcript record is associated to a catalog record for giving context to the transcript record. 2019 uses SCED codes for categorizing courses.

Value

an edsurvey.data.frame for the HSTS dataset.

---

readICILS   *Connect to ICILS Data*

Description

Opens a connection to an ICILS data file residing on the disk and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readICILS(
  path,
  countries,
  dataSet = c("student", "teacher"),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path	a character value to the full directory path to the ICILS extracted SPSS (.sav) set of data
countries	a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found on Wikipedia at https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes or other online sources. Consult the *ICILS User Guide* to help determine what countries are included within a specific testing year of ICILS. To select all countries, use a wildcard value of *.
dataSet	a character value of either student (the default if not specified) or teacher to indicate which set of data is returned. The student-level and teacher-level datasets cannot both be returned at the same time, unlike other IEA datasets.
forceReread	a logical value to force rereading of all processed data. The default value of FALSE will speed up the readICILS function by using existing read-in data already processed.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the ICILS international dataset(s) using the IEA Study Data Repository. Data files require the SPSS data file (.sav) format using the default filenames.

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if multiple countries specified

Author(s)

Tom Fink and Jeppe Bundsgaard (updated for 2018 and 2023)

See Also

readNAEP, readTIMSS, and getData

Examples

```
## Not run:
pol <- readICILS("~/ICILS/2013", countries = "pol", dataSet = "student")
gg <- getData(data=pol, varnames=c("idstud", "cil", "is1g18b"))
head(gg)
edsurveyTable(formula=cil ~ is1g18b, pol)

## End(Not run)
```

---

readNAEP   *Connect to NAEP Data*

Description

Opens a connection to a Main NAEP, or Long-Term Trend NAEP data file residing on the disk. Returns an edsurvey.data.frame with information about the file and data.

Usage

```
readNAEP(
  path,
  defaultWeight = "origwt",
  defaultPvs = "composite",
  omittedLevels = c("Multiple", NA, "Omitted"),
  frPath = NULL,
  xmlPath = NULL
)
```

Arguments

path	a character value indicating the full filepath location and name of the (.dat) data file
defaultWeight	a character value that indicates the default weight specified in the resulting edsurvey.data.frame. Default value is origwt if not specified.

defaultPvs   a character value that indicates the default plausible value specified in the result-
                  ing edsurvey.data.frame. Default value is composite if not specified.

omittedLevels   a character vector indicating which factor levels/labels should be excluded. When
                  set to the default value of c('Multiple',NA,'Omitted'), adds the vector to the
                  edsurvey.data.frame.

frPath   a character value indicating the file location of the .fr2 parameter layout file in-
                  cluded with the data companion to parse the specified path data file. The default
                  value of NULL will attempt to search the parent directory for the corresponding
                  .fr2 file for the specified path data file.

xmlPath   a character value indicating the file path of the .xml parameter layout file in-
                  cluded as part of the NAEPEX companion. This file provides necessary infor-
                  mation required to read and parse the (.dat) data file. The default value of NULL
                  will attempt to search the parent directory for the corresponding .xml file for
                  the specified path data file.

Details

The frPath file layout information will take precedence over the xmlPath file when the xmlPath is
not explicitly set, or when the xmlPath file cannot be located.

The readNAEP function includes both scaled scores and theta scores, with the latter having names
ending in _theta.

When a NAEP administration includes a linking error variable those variables are included and end
in _linking. When present, simply use the _linking version of a variable to get a standard error
estimate that includes linking error.

This function supports both the Main NAEP data files, and Long-Term Trend NAEP data files. A
table outlining the differences can be found on the NAEP Nations Report Card website.

Value

An edsurvey.data.frame for a NAEP data file.

Author(s)

Tom Fink and Ahmad Emad

See Also

edsurvey.data.frame getData

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))
sdf

# To read in an NCES file first set the directory to the /Data subfolder,
# then read in the appropriate .dat file:
```

```
setwd("location/of/Data")
sdf <- readNAEP(path="M36NT2PM.dat")

# Or read in the .dat file directly through the folder pathway:
sdf <- readNAEP(path="location/of/Data/M36NT2PM.dat")

## End(Not run)
```

---

readNHES   *Connect to NHES Survey Data*

Description

Opens a connection to a National Household Education Survey (NHES) data file and returns an
edsurvey.data.frame with information about the file and data.

Usage

```
readNHES(savFiles, surveyCode = "auto", forceReread = FALSE, verbose = TRUE)
```

Arguments

savFiles   a character vector to the full file path(s) to the NHES extracted SPSS (*.sav)
               data files.

surveyCode   a character vector of the surveyCode to identify the year and survey type of the
               passed savFiles data file(s). The default value is set to auto which attempts
               to automatically identify the survey/year based on the file attributes. Occasion-
               ally, the auto lookup may be unable to determine the surveyCode and must be
               explicitly set by the user. The lengths of the savFiles vector and surveyCode
               vector must match, unless surveyCode is set to auto. To view the surveyCodes
               available, use the getNHES_SurveyInfo, or viewNHES_SurveyCodes function
               to view the codes.

forceReread   a logical value to force a rereading of all processed data. The default value of
               FALSE speeds up the readNHES function by using existing read-in data if already
               processed.

verbose   a logical value that defaults to TRUE for verbose console output that indicates
               progress information. If verbose = FALSE, no information will be printed.

Details

Reads in the unzipped public-use files downloaded from the NCES Online Codebook (https://nces.ed.gov/datalab/onlinecodebook) in SPSS (*.sav) format. Other sources of NHES data,
such as restricted-use files or other websites, may require additional conversion steps to generate
the required SPSS data format and/or explicitly setting the surveyCode parameter.

Value

an `edsurvey.data.frame` if only one NHES file is specified for the `savFiles` argument, or an `edsurvey.data.frame.list` if multiple files are passed to the `savFiles` argument

Author(s)

Tom Fink

[downloadNHES](), [getNHES_SurveyInfo](), and [viewNHES_SurveyCodes]()

Examples

```
## Not run:
rootPath <- "~/"

#get instructions for obtaining NHES data
downloadNHES()

#get SPSS *.sav file paths of all NHES files for 2012 and 2016
filesToImport <- list.files(path = file.path(rootPath, "NHES", c(2012, 2016)),
                            pattern="\\.sav$",
                            full.names = TRUE,
                            recursive = TRUE)

#import all files to edsurvey.data.frame.list object
esdfList <- readNHES(savFiles = filesToImport, surveyCode = "auto",
                     forceReread = FALSE, verbose = TRUE)

viewNHES_SurveyCodes() #view NHES survey codes in console

#get the full file path to the 2016 ATES NHES survey
path_ates2016 <- list.files(path = file.path(rootPath, "NHES", "2016"),
                            pattern=".*ates.*[.]sav$", full.names = TRUE)

#explicitly setting the surveyCode parameter (if required)
esdf <- readNHES(savFiles = path_ates2016, surveyCode = "ATES_2016",
                 forceReread = FALSE, verbose = TRUE)

#search for variables in the edsurvey.data.frame
searchSDF(string="sex", data=esdf)

## End(Not run)
```

---

readPIAAC   *Connect to PIAAC Data*

Description

Opens a connection to a PIAAC data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readPIAAC(
  path,
  countries,
  forceReread = FALSE,
  verbose = TRUE,
  usaOption = "12_14"
)
```

Arguments

path	a character value to the full directory path to the PIAAC .csv files and Microsoft Excel codebook
countries	a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found in the PIAAC codebook or https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes. If files are downloaded using downloadPIAAC, a country dictionary text file can be found in the filepath. You can use * to indicate all countries available. For the usa, the year must be specified using: usa12_14 or usa17.
forceReread	a logical value to force rereading of all processed data. Defaults to FALSE. Setting forceReread to be TRUE will cause PIAAC data to be reread and increase the processing time.
verbose	a logical value that will determine if you want verbose output while the function is running to indicate the progress. Defaults to TRUE.
usaOption	a character value of 12_14 or 17 that specifies what year of the USA survey should be used when loading all countries by using * in the countries argument. This will only make a difference when loading all countries. Defaults to 12_14.

Details

Reads in the unzipped .csv files downloaded from the PIAAC dataset using the OECD repository (https://www.oecd.org/skills/piaac/). Users can use downloadPIAAC to download all required files automatically.

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if multiple countries specified

Author(s)

Trang Nguyen

                       countries = "*", usaOption="17")

## End(Not run)
```

---

readPIRLS   *Connect to PIRLS Data*

Description

Opens a connection to a PIRLS data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readPIRLS(path, countries, forceReread = FALSE, verbose = TRUE)
```

Arguments

path	a character value to the full directory path to the PIRLS extracted SPSS (.sav) set of data
countries	a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found on Wikipedia at https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes or other online sources. Consult the *PIRLS User Guide* to help determine what countries are included within a specific testing year of PIRLS. To select all countries, use a wildcard value of *.
forceReread	a logical value to force rereading of all processed data. The default value of FALSE will speed up the readPIRLS function by using existing read-in data already processed.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the PIRLS international database(s) using the [IEA Study Data Repository](). Data files require the SPSS data file (.sav) format using the default file-names.

A PIRLS edsurvey.data.frame includes three distinct data levels:

- student
- school
- teacher

When the getData function is called using a PIRLS edsurvey.data.frame, the requested data variables are inspected, and it handles any necessary data merges automatically. The school data always will be returned merged to the student data, even if only school variables are requested. If teacher variables are requested by the getData call, it will cause teacher data to be merged. Many students can be linked to many teachers, which varies widely between countries.

Please note that calling the dim function for a PIRLS edsurvey.data.frame will result in the row count as if the teacher dataset was merged. This row count will be considered the full data N of the edsurvey.data.frame, even if no teacher data were included in an analysis. The column count returned by dim will be the count of unique column variables across all three data levels.

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if multiple countries specified

Author(s)

Tom Fink

head(gg)
edsurveyTable(formula=rrea ~ itsex, nor)

## End(Not run)
```

---

readPISA   *Connect to PISA Data*

Description

Opens a connection to a PISA data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readPISA(
  path,
  database = c("INT", "CBA", "FIN"),
  countries,
  cognitive = c("score", "response", "none"),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path   a character vector to the full directory path(s) to the PISA-extracted fixed-width files and SPSS control files (.txt).

database   a character to indicate a selected database. Must be one of INT (general database that most people use), CBA (computer-based database in PISA 2012 only), or FIN (financial literacy database in PISA 2012 and 2018). Defaults to INT.

countries   a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found in the PISA codebook or https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes. If files are downloaded using downloadPISA, a country dictionary text file can be found in the filepath.

cognitive   one of none, score, or response. Default is score. The PISA database of-
               ten has three student files: student questionnaire, cognitive item response, and
               scored cognitive item response. The first file is used as the main student file with
               student background information. Users can choose whether to merge score or
               response data into the main file or not (if none).

forceReread   a logical value to force rereading of all processed data. Defaults to FALSE. Set-
               ting forceReread to be TRUE will cause PISA data to be reread and increase
               processing time.

verbose   a logical value that will determine if you want verbose output while the function
               is running to indicate progress. Defaults to TRUE.

Details

Reads in the unzipped files downloaded from the PISA database using the OECD Repository
(https://www.oecd.org/pisa/). Users can use downloadPISA to download all required files.
Student questionnaire files (with weights and plausible values) are used as main files, which are
then merged with cognitive, school, and parent files (if available).

The average first-time processing time for 1 year and one database for all countries is 10–15 min-
utes. If forceReread is set to be FALSE, the next time this function is called will take only 5–10
seconds.

For the PISA 2000 study, please note that the study weights are subject specific. Each weight has
different adjustment factors for reading, mathematics, and science based on it's original subject
source file. For example, the w_fstuwt_read weight is associated with the reading subject data
file. Special care must be used to select the correct weight based on your specific analysis. See the
OECD documentation for further details. Use the showWeights function to see all three student
level subject weights:

- **w_fstuwt_read** = Reading (default)
- **w_fstuwt_scie** = Science
- **w_fstuwt_math** = Mathematics

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if mul-
tiple countries are specified

Author(s)

Tom Fink, Trang Nguyen, and Paul Bailey

readPISA_YAFS   *PISA YAFS (Young Adult Follow-up Study)*

Description

Opens a connection to the Programme for International Student Assessment (PISA) YAFS 2016
data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readPISA_YAFS(
  datPath = file.path(getwd(), "PISA_YAFS2016_Data.dat"),
  spsPath = file.path(getwd(), "PISA_YAFS2016_SPSS.sps"),
  esdf_PISA2012_USA = NULL
)
```

Arguments

datPath   a character value of the file location where the data file (.dat) file is saved.

spsPath   a character value of the file location where the SPSS (.sps) script file is saved to
                   parse the datPath data file.

esdf_PISA2012_USA
                   (optional) an edsurvey.data.frame of the USA PISA 2012 data if planning to
                   analyze the PISA YAFS data alongside the USA PISA 2012 dataset.

Details

Reads in the unzipped files for the PISA YAFS. The PISA YAFS dataset is a follow-up study of a
subset of the students who participated in the PISA 2012 USA study. It can be analyzed on its own
as a singular dataset or optionally merged with the PISA 2012 USA data, in which case there will
be two sets of weights in the merged dataset (the default PISA YAFS weights and the PISA 2012
USA weights).

Value

An edsurvey.data.frame for the PISA YAFS dataset if the esdf_PISA2012_USA parameter is NULL. If the PISA 2012 USA edsurvey.data.frame is specified for the esdf_PISA2012_USA parameter, then the resulting dataset will return an edsurvey.data.frame allowing analysis for a combined dataset.

readSSOCS   *Connect to School Survey on Crime and Safety Data*

Description

Opens a connection to a School Survey on Crime and Safety (SSOCS) data file and returns an edsurvey.data.frame, or an edsurvey.data.frame.list if multiple files specified, with information about the file(s) and data.

Usage

```
readSSOCS(sasDataFiles, years, forceReread = FALSE, verbose = TRUE)
```

Arguments

sasDataFiles	a character vector to the full SAS (*.sas7bdat) data file path(s) you wish to read. If multiple paths are specified as a vector, it will return an edsurvey.data.frame.list.
years	an integer vector of the year associated with the index position of the sasDataFile data file vector. The year is required to correctly determine required metadata about the file. Valid year values are as follows: 2000 (1999–2000), 2004 (2003–2004), 2006 (2005–2006), 2008 (2007–2008), 2010 (2009–2010), 2016 (2015–2016), 2018 (2017–2018).
forceReread	a logical value to force rereading of all processed data. The default value of FALSE will speed up the readSSOCS function by using existing read-in data already processed.
verbose	a logical value to either print or suppress status message output. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the SSOCS Data Products website in SAS format. Other sources of SSOCS data, such as restricted-use data or other websites, may require additional conversion steps to generate the required SAS format.

Value

An edsurvey.data.frame if one data file is specified or an edsurvey.data.frame.list if multiple files are specified in the sasDataFiles parameter.

Note

For the readSSOCS function, value label information is stored and retrieved automatically within the EdSurvey package (based on the year parameter), as the SAS files contain only raw data values.

readTALIS   *Connect to TALIS Data*

Description

Opens a connection to a TALIS data file and returns an edsurvey.data.frame with information
about the file and data.

Usage

```
readTALIS(
  path,
  countries,
  isced = c("b", "a", "c"),
  dataLevel = c("teacher", "school"),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path   a character vector to the full directory path(s) to the TALIS SPSS files (.sav)

countries   a character vector of the country/countries to include using the three-digit ISO
                country code. A list of country codes can be found in the TALIS codebook, or
                you can use https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes.
                You can use * to indicate all countries available.

isced   a character value that is one of a, b, or c. a stands for *Primary Level*, b is for
                Lower Secondary Level, and c is for *Upper Secondary Level*. Default to b.

dataLevel   a character value that indicates which data level to be used. It can be teacher
                (the default) or school (see details).

forceReread	a logical value to force rereading of all processed data. Defaults to FALSE. Setting forceReread to be TRUE will cause readTALIS data to be reread and increase processing time.
verbose	a logical value that will determine if you want verbose output while the function is running to indicate the progress. Defaults to TRUE.

Details

Reads in the unzipped files downloaded from the TALIS database using the OECD Repository (https://www.oecd.org/education/talis/). If dataLevel is set to be teacher, it treats the teacher data file as the main dataset, and merges school data into teacher data for each country automatically. Use this option if wanting to analyze just teacher variables, or both teacher and school level variables together. If dataLevel is set school, it uses only the school data file (no teacher data will be available).

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if multiple countries specified

---

readTIMSS	*Connect to TIMSS Data*

Description

Opens a connection to a TIMSS data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readTIMSS(
  path,
  countries,
  gradeLvl = c("4", "8", "4b", "8b"),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path   a character vector to the full directory path(s) to the TIMSS extracted SPSS (.sav) set of data

countries   a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found on Wikipedia at https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes or other online sources. Consult the *TIMSS User Guide* documentation to help determine what countries are included within a specific testing year of TIMSS and for country code definitions. To select all countries available, use a wildcard value of *.

gradeLvl   a character value to indicate the specific grade level you wish to return

- **4** = fourth grade (the default if not specified)
- **8** = eighth grade
- **4B** = fourth grade bridge study (TIMSS 2019 only)
- **8B** = eight grade bridge study (TIMSS 2019 only)

forceReread   a logical value to force rereading of all processed data. The default value of FALSE will speed up the readTIMSS function by using existing read-in data already processed.

verbose   a logical value to either print or suppress status message output. The default
                   value is TRUE.

Details

Reads in the unzipped files downloaded from the TIMSS international database(s) using the IEA
Study Data Repository. Data files require the SPSS data file (.sav) format using the default file-
names.

A TIMSS edsurvey.data.frame includes three distinct data levels:

- student
- school
- teacher

When the getData function is called using a TIMSS edsurvey.data.frame, the requested data
variables are inspected, and it handles any necessary data merges automatically. The school data
always will be returned merged to the student data, even if only school variables are requested.
If teacher variables are requested by the getData call, it will cause teacher data to be merged.
Many students can be linked to many teachers, which varies widely between countries.

Please note that calling the dim function for a TIMSS edsurvey.data.frame will result in the row
count as if the teacher dataset was merged. This row count will be considered the full data N
of the edsurvey.data.frame, even if no teacher data were included in an analysis. The column
count returned by dim will be the count of unique column variables across all three data levels.

Beginning with TIMSS 2015, a numeracy dataset was designed to assess mathematics at the end
of the primary school cycle for countries where most children are still developing fundamental
mathematics skills. The numeracy dataset is handled automatically for the user and is included
within the fourth-grade dataset gradeLvl=4. Most numeracy countries have a 4th grade dataset in
addition to their numeracy dataset, but some do not. For countries that have both a numeracy and a
4th grade dataset, the two datasets are combined into one edsurvey.data.frame for that country.
Data variables missing from either dataset are kept, with NA values inserted for the dataset records
where that variable did not exist. Data variables common to both datasets are kept as a single data
variable, with records retaining their original values from the source dataset. Consult the *TIMSS
User Guide* for further information.

For the TIMSS 2019 study, a bridge study was conducted to help compute adjustment factors be-
tween the electronic test format and the paper/pencil format. The bridge study is considered separate
from the normal TIMSS 2019 study. The gradeLvl parameter now includes a "4B" option for the
Grade 4 bridge study, and the "8B" option for the Grade 8 bridge study files.

Value

an edsurvey.data.frame for a single specified country or an edsurvey.data.frame.list if mul-
tiple countries specified

readTIMSSAdv *Connect to TIMSS Advanced Data*

Description

Opens a connection to a TIMSS Advanced data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
readTIMSSAdv(
  path,
  countries,
  subject = c("math", "physics"),
  forceReread = FALSE,
  verbose = TRUE
)
```

Arguments

path
: a character vector to the full directory path to the TIMSS Advanced extracted SPSS (.sav) set of data

countries
: a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found on Wikipedia at https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes or other online sources. Consult the *TIMSS Advanced User Guide* to help determine what countries are included within a specific testing year of TIMSS Advanced. To select all countries, use a wildcard value of *.

subject   a character value to indicate if you wish to import the math or physics dataset. Only one subject can be read in at a time.

forceReread   a logical value to force rereading of all processed data. The default value of FALSE will speed up the readTIMSSAdv function by using existing read-in data already processed.

verbose   a logical value to either print or suppress status message output. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the TIMSS Advanced international database(s) using the IEA Study Data Repository. Data files require the SPSS data file (.sav) format using the default filenames.

A TIMSS Advanced edsurvey.data.frame includes three distinct data levels:

- student

- school

- teacher

When the getData function is called using a TIMSS Advanced edsurvey.data.frame, the requested data variables are inspected, and it handles any necessary data merges automatically. The school data always will be returned merged to the student data, even if only school variables are requested. If teacher variables are requested by the getData call it will cause the teacher data to be merged. Many students can be linked to many teachers, which varies widely between countries.

Please note that calling the dim function for a TIMSS Advanced edsurvey.data.frame will result in the row count as if the teacher dataset was merged. This row count will be considered the full data N of the edsurvey.data.frame, even if no teacher data were included in an analysis. The column count returned by dim will be the count of unique column variables across all three data levels.

read_ePIRLS   *Connect to ePIRLS Data*

Description

Opens a connection to an ePIRLS data file and returns an edsurvey.data.frame with information about the file and data.

Usage

```
read_ePIRLS(path, countries, forceReread = FALSE, verbose = TRUE)
```

Arguments

path   a character value to the full directory path to the ePIRLS extracted SPSS (.sav) set of data

countries   a character vector of the country/countries to include using the three-digit ISO country code. A list of country codes can be found on Wikipedia at https://en.wikipedia.org/wiki/ISO_3166-1#Current_codes or other online sources. Consult the *ePIRLS User Guide* to help determine what countries are included within a specific testing year of ePIRLS. To select all countries, use a wildcard value of *.

forceReread   a logical value to force rereading of all processed data. The default value of FALSE will speed up the read_ePIRLS function by using existing read-in data already processed.

verbose   a logical value to either print or suppress status message output. The default value is TRUE.

Details

Reads in the unzipped files downloaded from the ePIRLS international database(s) using the IEA Study Data Repository. Data files require the SPSS data file (.sav) format using the default file-names.

An ePIRLS edsurvey.data.frame includes three distinct data levels:

- student

- school

- teacher

When the getData function is called using an ePIRLS edsurvey.data.frame, the requested data variables are inspected, and it handles any necessary data merges automatically. The school data always will be returned merged to the student data, even if only school variables are requested. If teacher variables are requested by the getData call, it will cause teacher data to be merged. A student can be linked to many teachers, which varies widely between countries.

Please note that calling the dim function for an ePIRLS edsurvey.data.frame will result in the row count as if the teacher dataset was merged. rebindAttributes   *Copy Data Frame Attributes*

Description

Many R functions strip attributes from data frame objects. This function assigns the attributes from the attributeData argument to the data frame in the data argument.

Usage

```
rebindAttributes(data, attributeData)
```

Arguments

`data`	a `data.frame`
`attributeData`	an `edsurvey.data.frame` or `light.edsurvey.data.frame` that contains the desired attributes

Value

a `data.frame` with a class of a `light.edsurvey.data.frame` containing all elements of data and the attributes (except `names` and `row.names`) from `attributeData`

Author(s)

Paul Bailey and Trang Nguyen

Examples

```
## Not run:
require(dplyr)
PISA2012 <- readPISA(path = paste0(edsurveyHome, "PISA/2012"),
                     database = "INT",
                     countries = "ALB", verbose=TRUE)
ledf <- getData(data = PISA2012, varnames = c("cnt", "oecd", "w_fstuwt",
                                              "st62q04", "st62q11",
                                              "st62q13", "math"),
                dropOmittedLevels = FALSE, addAttributes = TRUE)

```

---

recode.sdf   *Recode Levels Within Variables*

Description

Recodes variables in an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`.

Usage

```
recode.sdf(x, recode)
```

Arguments

x   an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`

recode   a list of recoding rules. See Examples for the format of recoding rules.

Value

an object of the same class as x with the `recode` added to it

Author(s)

Trang Nguyen and Paul Bailey

Examples

```
## Not run:
# filepath argument will vary by operating system conventions
usaG4.15 <- readTIMSS(path="~/TIMSS/2015", "usa", 4)
d <- getData(usaG4.15, "itsex")
summary(d) #show details: MALE/FEMALE
usaG4.15 <- recode.sdf(usaG4.15,
                       recode = list(itsex=list(from=c("MALE"),
                                                to=c("BOY")),
                                     itsex=list(from=c("FEMALE"),
                                                to=c("GIRL"))))

d <- getData(usaG4.15, "itsex") #apply recode
summary(d) #show details: BOY/GIRL

## End(Not run)
```

---

rename.sdf   *Modify Variable Names*

Description

Renames variables in an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`. This function often is used when users want to conduct a gap analysis across years but variable names differ across two years of data.

Usage

```
rename.sdf(x, oldnames, newnames, avoid_duplicated = TRUE)
```

Arguments

`x`	an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`
`oldnames`	a character vector of old variable names
`newnames`	a character vector of new variable names to replace the corresponding old names
`avoid_duplicated`	
	a logical value to indicate whether to avoid renaming the variable if the corresponding new name already exists in the data. Defaults to `TRUE`.

Details

All variable names are coerced to lowercase to comply with the `EdSurvey` standard.

Value

an object of the same class as `x` with new variable names

Author(s)

Trang Nguyen

See Also

[gap](#)

Examples

```
## Not run:
usaG4.15 <- readTIMSS(path="~/TIMSS/2015", "usa", 4)

                               oldnames=c("itsex", "mmat"),
                               newnames=c("gender", "math_overall"))
lm1 <- lm.sdf(formula=math_overall ~ gender, data = usaG4.15.renamed)
summary(lm1)

## End(Not run)
```

roundn	*rounding helper*

Description

rounding helper

Usage

```
roundn(n)
```

Arguments

n   round to this level

Value

a function that rounds to n

Author(s)

Paul Bailey

roundNCES	*rounding helper for NCES*

Description

rounding helper for NCES

Usage

```
roundNCES(n)
```

Arguments

n   the value to be rounded; accepts a vector

Value

the rounded value

Author(s)

Paul Bailey

Description

Fits a quantile regression model that uses weights and variance estimates appropriate for the data.

Usage

```
rq.sdf(
  formula,
  data,
  tau = 0.5,
  weightVar = NULL,
  relevels = list(),
  jrrIMax = 1,
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  returnNumberOfPSU = FALSE,
  omittedLevels = deprecated(),
  ...
)
```

Arguments

formula	a formula for the quantile regression model. See rq in the quantreg package. If *y* is left blank, the default subject scale or subscale variable will be used. (You can find the default using showPlausibleValues.) If *y* is a variable for a subject scale or subscale (one of the names shown by showPlausibleValues), then that subject scale or subscale is used.
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
tau	the quantile to be estimated. The value could be set between 0 and 1 with a default of 0.5.
weightVar	a character indicating the weight variable to use. The weightVar must be one of the weights for the edsurvey.data.frame. If NULL, it uses the default for the edsurvey.data.frame.
relevels	a list. Used to change the contrasts from the default treatment contrasts to the treatment contrasts with a chosen omitted group (the reference group). The name of each element should be the variable name, and the value should be the group to be omitted (the reference group).
jrrIMax	when using the jackknife variance estimation method, the default estimation option, jrrIMax=1, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The V_{jrr} term can be estimated with any number of plausible values, and values larger than the number

of plausible values on the survey (including Inf) will result in all plausible values being used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.

dropOmittedLevels

a logical value. When set to the default value of TRUE, drops those levels of all factor variables that are specified in an edsurvey.data.frame. Use print on an edsurvey.data.frame to see the omitted levels.

defaultConditions

a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.

recode   a list of lists to recode variables. Defaults to NULL. Can be set as recode=list(var1 = list(from= c("a", "b", "c"), to= "d")).

returnNumberOfPSU

a logical value set to TRUE to return the number of primary sampling units (PSUs)

omittedLevels   this argument is deprecated. Use dropOmittedLevels

...   additional parameters passed from rq

Details

The function computes an estimate on the tau-th conditional quantile function of the response, given the covariates, as specified by the formula argument. Like lm.sdf(), the function presumes a linear specification for the quantile regression model (i.e., that the formula defines a model that is linear in parameters). Unlike lm.sdf(), the jackknife is the only applicable variance estimation method used by the function.

For further details on quantile regression models and how they are implemented in R, see Koenker and Bassett (1978), Koenker (2005), and the vignette from the quantreg package— accessible by vignette("rq",package="quantreg")—on which this function is built.

For further details on how left-hand side variables, survey sampling weights, and estimated variances are correctly handled, see lm.sdf or the vignette titled *Statistical Methods Used in EdSurvey*.

Value

An edsurvey.rq with the following elements:

call	the function call
formula	the formula used to fit the model
tau	the quantile to be estimated
coef	the estimates of the coefficients
se	the standard error estimates of the coefficients
Vimp	the estimated variance from uncertainty in the scores (plausible value variables)
Vjrr	the estimated variance from sampling
M	the number of plausible values
varm	the variance estimates under the various plausible values

coefm	the values of the coefficients under the various plausible values
coefmat	the coefficient matrix (typically produced by the summary of a model)
weight	the name of the weight variable
npv	the number of plausible values
njk	the number of the jackknife replicates used; set to NA when Taylor series variance estimates are used
rho	the mean value of the objective function across the plausible values

---

scoreDefault   *Assessment scoring*

Description

Score assessments

Usage

```
scoreDefault(edf, polyParamTab, dichotParamTab, scoreDict)
```

Arguments

edf	the data
polyParamTab	see [mml.sdf](#)
dichotParamTab	see [mml.sdf](#)
scoreDict	a data frame; see Details.

Details

default scorer scores column on edf identified by polyParamTab$ItemID, dichotParamTab$ItemID using a crosswalk in scoreDict

the `scoreDict` is a data frame in long format with columns key, answer, and score. the function maps, within the item identified by key from answer to score.

Value

a data frame with the columns in the `scoreDict` key column mapped from answer to score.

Author(s)

Paul Bailey and Tom Fink

[mml.sdf](#)

---

scoreTIMSS   *EdSurvey Direct Estimation - TIMSS scoring*

Description

Scoring TIMSS data

Usage

```
scoreTIMSS(edf, polyParamTab, dichotParamTab, scoreCard = NULL)
```

Arguments

edf	a TIMSS `light.edsurvey.data.frame` or `edsurvey.data.frame`
polyParamTab	a dataframe containing IRT parameters for all polytomous items in `edf`
dichotParamTab	a dataframe containing IRT parameters for all dichotomous items in `edf`
scoreCard	unused

Details

This function scores TIMSS data. For multiple choice items, correct answers are assigned 1 point, and incorrect answers are assigned 0 points. For constructed response items, correct answers are assigned 2 points, partially correct answers are assigned 1 point, and incorrect answers are assigned 0 points. For both types of items, "NOT REACHED" and "OMITTED OR INVALID" are assigned 0 points. these defaults can be changed by modifying the `scoreDict` columns `pointMult` and `pointConst`, respectively.

Value

scored `edf`

SD   *EdSurvey Standard Deviation*

Description

Calculate the standard deviation of a numeric variable in an `edsurvey.data.frame`.

Usage

```
SD(
  data,
  variable,
  weightVar = NULL,
  jrrIMax = 1,
  varMethod = "jackknife",
  dropOmittedLevels = TRUE,
  defaultConditions = TRUE,
  recode = NULL,
  targetLevel = NULL,
  jkSumMultiplier = getAttributes(data, "jkSumMultiplier"),
  returnVarEstInputs = FALSE,
  omittedLevels = deprecated()
)
```

Arguments

data	an edsurvey.data.frame, an edsurvey.data.frame.list, or a light.edsurvey.data.frame
variable	character vector of variable names
weightVar	character weight variable name. Default is the default weight of data if it exists. If the given survey data do not have a default weight, the function will produce unweighted statistics instead. Can be set to NULL to return unweighted statistics.
jrrIMax	a numeric value; when using the jackknife variance estimation method, the default estimation option, jrrIMax=1, uses the sampling variance from the first plausible value as the component for sampling variance estimation. The Vjrr term (see *Statistical Methods Used in EdSurvey*) can be estimated with any number of plausible values, and values larger than the number of plausible values on the survey (including Inf) will result in all plausible values being used. Higher values of jrrIMax lead to longer computing times and more accurate variance estimates.
varMethod	deprecated parameter; gap always uses the jackknife variance estimation
dropOmittedLevels	
	a logical value. When set to TRUE, drops those levels of the specified variable. Use print on an edsurvey.data.frame to see the omitted levels. Defaults to FALSE.
defaultConditions	
	a logical value. When set to the default value of TRUE, uses the default conditions stored in an edsurvey.data.frame to subset the data. Use print on an edsurvey.data.frame to see the default conditions.
recode	a list of lists to recode variables. Defaults to NULL. Can be set as recode = list(var1 = list(from = c("a","b","c"), to = "d")).
targetLevel	a character string. When specified, calculates the gap in the percentage of students at targetLevel in the variable argument, which is useful for comparing the gap in the percentage of students at a survey response level.

jkSumMultiplier

> when the jackknife variance estimation method—or balanced repeated repli-
> cation (BRR) method—multiplies the final jackknife variance estimate by a
> value, set jkSumMultiplier to that value. For an edsurvey.data.frame, or a
> light.edsurvey.data.frame, the recommended value can be recovered with
> EdSurvey::getAttributes(myData, "jkSumMultiplier").

returnVarEstInputs

> a logical value set to TRUE to return the inputs to the jackknife and imputation
> variance estimates, which allows for the computation of covariances between
> estimates.

omittedLevels   this argument is deprecated. Use dropOmittedLevels

Value

a list object with elements:

mean	the mean assessment score for variable, calculated according to the vignette titled Statistical Methods Used in EdSurvey
std	the standard deviation of the mean
stdSE	the standard error of the std
df	the degrees of freedom of the std
varEstInputs	the variance estimate inputs used for calculating covariances with varEstToCov. Only returned with returnVarEstInputs is TRUE

Author(s)

Paul Bailey and Huade Huo

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# get standard deviation for Male's composite score
SD(data = subset(sdf, dsex == "Male"), variable = "composite")

# get several standard deviations

# build an edsurvey.data.frame.list
sdfA <- subset(sdf, scrpsu %in% c(5,45,56))
sdfB <- subset(sdf, scrpsu %in% c(75,76,78))
sdfC <- subset(sdf, scrpsu %in% 100:200)
sdfD <- subset(sdf, scrpsu %in% 201:300)

sdfl <- edsurvey.data.frame.list(datalist=list(sdfA, sdfB, sdfC, sdfD),
                                 labels=c("A locations",
                                          "B locations",
                                          "C locations",
                                          "D locations"))
```

```
# this shows how these datasets will be described:
sdfl$covs

# SD results for each survey
SD(data = sdfl, variable = "composite")
# SD results more compactly and with comparisons
gap(variable="composite", data=sdfl, stDev=TRUE, returnSimpleDoF=TRUE)

## End(Not run)
```

---

searchSDF   *EdSurvey Codebook Search*

Description

Retrieves variable names and labels for an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list using character string matching.

Usage

```
searchSDF(string, data, fileFormat = NULL, levels = FALSE)
```

Arguments

string	a vector of character strings to search for in the database connection object (data). The function will search the codebook for a matching character string using regular expressions. When a string has several elements, all must be present for a variable to be returned.
data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
fileFormat	a character vector indicating the data source to search for variables. The default NULL argument searches all codebooks.
levels	a logical value; set to TRUE to return a snapshot of the levels in an edsurvey.data.frame

Value

a data.frame that shows the variable names, labels, and levels (if applicable) from an edsurvey.data.frame or a light.edsurvey.data.frame based on a matching character string

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# search both the student and school files by a character string
searchSDF(string="book", data=sdf)

# use the `|` (OR) operator to search several strings simultaneously
searchSDF(string="book|home|value", data=sdf)

# use a vector of strings to search for variables that contain multiple strings,
# such as both "book" and "home"
searchSDF(string=c("book","home"), data=sdf)

# search only the student files by a character string
searchSDF(string="algebra", data=sdf, fileFormat="student")

# search both the student and school files and return a glimpse of levels
searchSDF(string="value", data=sdf, levels=TRUE)

# save the search as an object to return a full data.frame of search
ddf <- searchSDF(string="value", data=sdf, levels=TRUE)
ddf

## End(Not run)
```

---

setNAEPScoreCard   *set NAEP Score Card*

Description

add item response theory data necessary to use `mml.sdf` on NAEP data

Usage

```
setNAEPScoreCard(data, dctPath = NULL)
```

Arguments

data   a NAEP edsurvey.data.frame

dctPath   a file location that points to the location of a NAEP .dct file (usually in the
              AM folder). A .dct file can be used to input custom item response theory (IRT)
              parameters and subscale/subtest weights for NAEP assessments compared with
              those provided in the NAEPirtparams package.

Value

a NAEP edsurvey.data.frame with updated attributes

Examples

```
## Not run:
datFP <- "~/NAEP_Folder/Data/M50NT3AT.dat"
sdf <- readNAEP(path=datFP)

#how to set NAEP mml attributes
#if readNAEP does not detect them automatically
dctFP <- "~/NAEP_Folder/AM/M50NT3AT.dct"
sdf <- setNAEPScoreCard(data=sdf, dctPath=dctFP)

## End(Not run)
```

---

showCodebook   *Summary Codebook*

Description

Retrieves variable names, variable labels, and value labels for an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
showCodebook(
  data,
  fileFormat = NULL,
  labelLevels = FALSE,
  includeRecodes = FALSE
)
```

Arguments

data	an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list
fileFormat	a character string indicating the data source to search for variables. The default NULL argument searches all available codebooks in the database connection object.
labelLevels	a logical value; set to TRUE to return a snapshot of the label levels in an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list. When set to FALSE (the default), label levels are removed.
includeRecodes	a logical value; set to TRUE to return value labels that have been recoded in an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list. When set to FALSE (the default), only the original value labels are included in the returned data.frame.

Value

a data.frame that shows the variable names, variable labels, value labels, value levels (if applicable), and the file format data source from an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# search both the student and school files, returning levels for variable values
showCodebook(data=sdf, fileFormat=c("student","school"), labelLevels = TRUE, includeRecodes = FALSE)

# return codebook information for the student file, excluding variable value levels,
# including recoded variables
sdf <- recode.sdf(sdf, recode = list(dsex = list(from = c("Male"), to = c("MALE"))))
showCodebook(data=sdf, fileFormat=c("student"), labelLevels = FALSE, includeRecodes = TRUE)

# return codebook information for the student file, including variable value levels
# and recoded variables
showCodebook(data=sdf, fileFormat=c("student","school"), labelLevels = FALSE, includeRecodes = TRUE)

# return codebook information for all codebooks in an edsurvey.data.frame; commonly use View()
View(showCodebook(data=sdf))

## End(Not run)
```

---

showCutPoints   *Retrieve Achievement Level Cutpoints*

Description

Retrieves a summary of the achievement level cutpoints for a selected study represented in an
edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
showCutPoints(data)
```

Arguments

data   an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

Value

If there are achievement levels defined, prints one line per subject scale. Each line names the subject
and then shows the cut point for each achievement level.

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# show the cut points
showCutPoints(data=sdf)

## End(Not run)
```

---

showPlausibleValues   *Plausible Value Variable Names*

Description

Prints a summary of the subject scale or subscale and the associated variables for their plausible values for an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
showPlausibleValues(data, verbose = FALSE)
```

Arguments

data   an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

verbose   a logical value; set to TRUE to get the variable names for plausible values. Otherwise, prints only the subject scale or subscale names for variables that use plausible values.

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# show the plausible values
showPlausibleValues(data=sdf, verbose=TRUE)

## End(Not run)
```

---

showWeights *Retrieve Weight Variables*

Description

Prints a summary of the weights in an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list.

Usage

```
showWeights(data, verbose = FALSE)
```

Arguments

data   an edsurvey.data.frame, a light.edsurvey.data.frame, or an edsurvey.data.frame.list

verbose   a logical value; set to TRUE to print the complete list of jackknife replicate weights associated with each full sample weight; otherwise, prints only the full sample weights

Author(s)

Michael Lee and Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package="NAEPprimer"))

# show the weights
showWeights(data=sdf, verbose=TRUE)

## End(Not run)
```

---

suggestWeights *Weight suggestions for ECLS-K:2011 data*

Description

Suggest Weights for ECLS-K:2011 data based on inputting variables.

Usage

```
suggestWeights(
  varnames = NULL,
  data,
  showAllWeightSuggestions = FALSE,
  verbose = FALSE
)
```

Arguments

varnames   character vector indicating variables to be included in the weight suggestion.

data   an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`

showAllWeightSuggestions

a logical value. When set to `TRUE`, all applicable weights that covers more components, which typically are more conservative with smaller sample size, will be returned. By default (i.e., `FALSE`), only the most approperate weight is displayed.

verbose   a logical value to either print or suppress status message output.

Details

`suggestWeights` provides one additional way to assist researchers in deciding which weight to use for analyses. This function find the intersect of possible weights given variables provided, and rank this intersect based on the number of components a weight can adjust.

The best weight would adjust for each and every source used and only those sources. However, for many analyses, there will be no weight that adjusts for nonresponse to all the sources of data that are included and for only those source. When no weight corresponds exactly to the combination of components included in the desired analysis, researchers might prefer to use a weight that includes nonresponse adjustments for more components than they are using in their analysis if that weight also includes nonresponse adjustments for the components they are using.

Researchers should always consult their research questions for optimal weight choice.

Value

A list of weight variables. The first one is the most approperate choice.

summary2   *Summarize edsurvey.data.frame Variables*

Description

Summarizes edsurvey.data.frame variables.

Usage

```
summary2(
  data,
  variable,
  weightVar = attr(getAttributes(data, "weights"), "default"),
  dropOmittedLevels = FALSE,
  omittedLevels = deprecated()
)
```

Arguments

data	an edsurvey.data.frame, an edsurvey.data.frame.list, or light.edsurvey.data.frame
variable	character vector of variable names
weightVar	character weight variable name. Default is the default weight of data if it exists. If the given survey data do not have a default weight, the function will produce unweighted statistics instead. Can be set to NULL to return unweighted statistics.
dropOmittedLevels	
	a logical value. When set to TRUE, drops those levels of the specified variable. Use print on an edsurvey.data.frame to see the omitted levels. Defaults to FALSE.
omittedLevels	this argument is deprecated. Use dropOmittedLevels

Value

summary of weighted or unweighted statistics of a given variable in an edsurvey.data.frame

For categorical variables, the summary results are a crosstab of all variables and include the following:

[variable name]	
	level of the variable in the column name that the row regards. There is one column per element of variable.
N	number of cases for each category. Weighted N also is produced if users choose to produce weighted statistics.
Percent	percentage of each category. Weighted percent also is produced if users choose to produce weighted statistics.
SE	standard error of the percentage statistics

For continuous variables, the summary results are by variable and include the following:

Variable	name of the variable the row regards
N	total number of cases (both valid and invalid cases)
Min.	smallest value of the variable
1st Qu.	first quantile of the variable
Median	median value of the variable
Mean	mean of the variable

`3rd Qu.`	third quantile of the variable
`Max.`	largest value of the variable
`SD`	standard deviation or weighted standard deviation
`NA's`	number of NA in variable and in weight variables
`Zero weights`	number of zero weight cases if users choose to produce weighted statistics

If the weight option is chosen, the function produces weighted percentile and standard deviation. Refer to the vignette titled *Statistical Methods Used in EdSurvey* and the vignette titled *Methods Used for Estimating Percentiles in EdSurvey* for how the function calculates these statistics (with and without plausible values).

updatePlausibleValue	*Update Plausible Value Variable Names*

Description

Changes the name used to refer to a set of plausible values from `oldVar` to `newVar` in an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`.

Usage

```
updatePlausibleValue(oldVar, newVar, data)
```

Arguments

`oldVar`	a character value indicating the existing name of the variable
`newVar`	a character value indicating the new name of the variable
`data`	an `edsurvey.data.frame`, a `light.edsurvey.data.frame`, or an `edsurvey.data.frame.list`

Value

an object of the same class as the `data` argument, with the name of the plausible value updated from `oldVar` to `newVar`

varEstToCov	*Covariance Estimation*

Description

When the variance of a derived statistic (e.g., a difference) is required, the covariance between the two statistics must be calculated. This function uses results generated by various functions (e.g., a [lm.sdf](#)) to find the covariance between two statistics.

Usage

```
varEstToCov(
  varEstA,
  varEstB = varEstA,
  varA,
  varB = varA,
  jkSumMultiplier,
  returnComponents = FALSE
)
```

Arguments

varEstA   a list of two data.frames returned by a function after the returnVarEstInputs argument was turned on. The statistic named in the varA argument must be present in each data.frame.

varEstB   a list of two data.frames returned by a function after the returnVarEstInputs argument was turned on. The statistic named in the varA argument must be present in each data.frame. When the same as varEstA, the covariance is within one result.

varA   a character that names the statistic in the varEstA argument for which a covariance is required

varB   a character that names the statistic in the varEstB argument for which a covariance is required

jkSumMultiplier

when the jackknife variance estimation method—or balanced repeated replication (BRR) method—multiplies the final jackknife variance estimate by a value, set jkSumMultiplier to that value. For an edsurvey.data.frame or a light.edsurvey.data.frame, the recommended value can be recovered with EdSurvey::getAttributes(myData, "jkSumMultiplier").

returnComponents

set to TRUE to return the imputation variance seperate from the sampling variance

Details

These functions are not vectorized, so varA and varB must contain exactly one variable name.

The method used to compute the covariance is in the vignette titled *Statistical Methods Used in EdSurvey*

The method used to compute the degrees of freedom is in the vignette titled *Statistical Methods Used in EdSurvey* in the section "Estimation of Degrees of Freedom."

Value

a numeric value; the jackknife covariance estimate. If returnComponents is TRUE, returns a vector of length three, V is the variance estimate, Vsamp is the sampling component of the variance, and Vimp is the imputation component of the variance

Paul Bailey

Examples

```
## Not run:
# read in the example data (generated, not real student data)
sdf <- readNAEP(path=system.file("extdata/data", "M36NT2PM.dat", package = "NAEPprimer"))

# estimate a regression
lm1 <- lm.sdf(formula=composite ~ dsex + b017451, data=sdf, returnVarEstInputs=TRUE)
summary(lm1)
# estimate the covariance between two regression coefficients
# note that the variable names are parallel to what they are called in lm1 output
jkSumMultiplier <- EdSurvey:::getAttributes(data=sdf, attribute="jkSumMultiplier")
covFEveryDay <- varEstToCov(varEstA=lm1$varEstInputs,
                            varA="dsexFemale",
                            varB="b017451Every day",
                            jkSumMultiplier=jkSumMultiplier)
# the estimated difference between the two coefficients
# note: unname prevents output from being named after the first coefficient
unname(coef(lm1)["dsexFemale"] - coef(lm1)["b017451Every day"])
# the standard error of the difference
# uses the formula SE(A-B) = sqrt(var(A) + var(B) - 2*cov(A,B))
sqrt(lm1$coefmat["dsexFemale", "se"]^2
     + lm1$coefmat["b017451Every day", "se"]^2
     - 2 * covFEveryDay)

## End(Not run)
```

---

viewNHES_SurveyCodes   *View NHES Survey Code Definitions*

Description

This function prints the defined NHES Survey Codes to console output that are compatible with
the readNHES function for use. Typically a user will only need to manually set these codes if the
'auto' survey parameter is not able to correctly identify the correct survey type, or for other unusual
situations.

Usage

```
viewNHES_SurveyCodes()
```

Author(s)

Tom Fink

waldTest	*Wald Tests*

Description

Tests on coefficient(s) of edsurveyGlm and edsurveyLm models.

Usage

```
waldTest(model, coefficients, H0 = NULL)
```

Arguments

model	an edsurveyGlm and edsurveyLm
coefficients	coefficients to be tested, by name or position in coef vector. See Details.
H0	reference values to test coefficients against, default = 0

Details

When plausible values are present, likelihood ratio tests cannot be used. However, the Wald test can be used to test estimated parameters in a model, with the null hypothesis being that a parameter(s) is equal to some value(s). In the default case where the null hypothesis value of the parameters is 0, if the test fails to reject the null hypothesis, removing the variables from the model will not substantially harm the fit of that model. Alternative null hypothesis values also can be specified with the H0 argument. See Examples.

Coefficients to test can be specified by an integer (or integer vector) corresponding to the order of coefficients in the summary output. Coefficients also can be specified using a character vector, to specify coefficient names to test. The name of a factor variable can be used to test all levels of that variable.

This test produces both chi-square and *F*-tests; their calculation is described in the vignette titled *Methods and Overview of Using EdSurvey for Running Wald Tests*.

Value

An edsurveyWaldTest object with the following elements:

Sigma	coefficient covariance matrix
coefficients	indices of the coefficients tested
H0	null hypothesis values of coefficients tested
result	result object containing the values of the chi-square and *F*-tests
hypoMatrix	hypothesis matrix used for the Wald Test
