

# Package ‘TruncExpFam’

July 22, 2025

**Title** Truncated Exponential Family

**Version** 1.2.1

**Date** 2025-04-10

**Description** Handles truncated members from the exponential family of probability distributions. Contains functions such as `rtruncnorm()` and `dtruncpois()`, which are truncated versions of `rnorm()` and `dpois()` from the `stats` package that also offer richer output containing, for example, the distribution parameters. It also provides functions to retrieve the original distribution parameters from a truncated sample by maximum-likelihood estimation.

**License** GPL-3

**Encoding** UTF-8

**RoxygenNote** 7.3.2

**Imports** methods, invgamma, rmutl

**Suggests** knitr, rmarkdown, testthat

**URL** <https://ocbe-uio.github.io/TruncExpFam/>

**BugReports** <https://github.com/ocbe-uio/TruncExpFam/issues>

**VignetteBuilder** knitr

**Language** en-US

**NeedsCompilation** no

**Author** René Holst [aut],  
Waldir Leoncio [cre, aut]

**Maintainer** Waldir Leoncio <w.l.netto@medisin.uio.no>

**Repository** CRAN

**Date/Publication** 2025-04-10 15:00:02 UTC

|-----------|-----------------------------------------------|
| .onAttach | <i>Prints welcome message on package load</i> |
|-----------|-----------------------------------------------|

---

Description

Prints package version number and welcome message on package load

Usage

`.onAttach(libname, pkgname)`

Arguments

- libname library location. See ?base::.onAttach for details
- pkgname package name. See ?base::.onAttach for details

---

|          |                                                                 |
|----------|-----------------------------------------------------------------|
| averageT | <i>Averages out the sufficient statistics <math>T(y)</math></i> |
|----------|-----------------------------------------------------------------|

---

**Description**

Takes a vector of values and returns the column average of their sufficient statistic (determined by their class)

**Usage**

```
averageT(y)
```

**Arguments**

y                      vector of values

**Value**

A vector with the average of the sufficient statistics

---

|            |                                     |
|------------|-------------------------------------|
| dtruncbeta | <i>Probability Density Function</i> |
|------------|-------------------------------------|

---

**Description**

Calculates the PDF for a given truncated distribution

**Usage**

```
dtruncbeta(y, shape1, shape2, eta, a = 0, b = 1, ...)
dtruncbinom(y, size, prob, eta, a = 0, b = attr(y, "parameters")$size, ...)
dtruncchisq(y, df, eta, a = 0, b = Inf, ...)
dtrunccontbern(y, lambda, eta, a = 0, b = 1, ...)
dtrunccontbern(y, lambda, eta, a = 0, b = 1, ...)
dtrunc(y, ...)
dtruncexp(y, rate = 1, eta, a = 0, b = Inf, ...)
dtruncgamma(y, shape, rate = 1, scale = 1/rate, eta, a = 0, b = Inf, ...)
dtruncinvgamma(y, shape, rate = 1, scale = 1/rate, eta, a = 0, b = Inf, ...)
```

```

dtruncinvgauss(y, m, s, eta, a = 0, b = Inf, ...)

dtrunclnorm(y, meanlog = 0, sdlog = 1, eta, a = 0, b = Inf, ...)

## S3 method for class 'trunc_nbinom'
dtrunc(y, size, prob, eta, a = 0, b = Inf, ...)

dtruncnbinom(y, size, prob, eta, a = 0, b = Inf, ...)

dtruncnbinom(y, size, prob, eta, a = 0, b = Inf, ...)

dtruncnorm(y, mean = 0, sd = 1, eta, a = -Inf, b = Inf, ...)

dtruncpois(y, lambda, eta, a = 0, b = Inf, ...)

```

### Arguments

|                      |                                                                                                                                                                         |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>y</code>       | output from <code>rtrunc</code> or any valid numeric value(s).                                                                                                          |
| <code>shape1</code>  | positive shape parameter alpha                                                                                                                                          |
| <code>shape2</code>  | positive shape parameter beta                                                                                                                                           |
| <code>eta</code>     | vector of natural parameters                                                                                                                                            |
| <code>a</code>       | point of left truncation. For discrete distributions, <code>a</code> will be included in the support of the truncated distribution.                                     |
| <code>b</code>       | point of right truncation                                                                                                                                               |
| <code>...</code>     | size                                                                                                                                                                    |
| <code>size</code>    | target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer. |
| <code>prob</code>    | probability of success on each trial                                                                                                                                    |
| <code>df</code>      | degrees of freedom for "parent" distribution                                                                                                                            |
| <code>lambda</code>  | mean and var of "parent" distribution                                                                                                                                   |
| <code>rate</code>    | inverse gamma rate parameter                                                                                                                                            |
| <code>shape</code>   | inverse gamma shape parameter                                                                                                                                           |
| <code>scale</code>   | inverse gamma scale parameter                                                                                                                                           |
| <code>m</code>       | vector of means                                                                                                                                                         |
| <code>s</code>       | vector of dispersion parameters                                                                                                                                         |
| <code>meanlog</code> | mean of untruncated distribution                                                                                                                                        |
| <code>sdlog</code>   | standard deviation of untruncated distribution                                                                                                                          |
| <code>mean</code>    | mean of parent distribution                                                                                                                                             |
| <code>sd</code>      | standard deviation is parent distribution                                                                                                                               |

**Value**

The density of  $y$  for the given values of the  $\eta$  parameter.

**Note**

Either the common or the natural parameters must be provided.

**Examples**

```
# Using the output of rtrunc
y <- rtrunc(50, mean = 5, sd = 2)
dtrunc(y, eta = c(0, -1))

# Directly-inputting values
dtruncnorm(y = c(5, 0, -10), eta = c(0, -0.05))
```

---

|                     |                                       |
|---------------------|---------------------------------------|
| empiricalParameters | <i>Calculate empirical parameters</i> |
|---------------------|---------------------------------------|

---

**Description**

Returns the empirical parameter estimate for a distribution

**Usage**

```
empiricalParameters(y, ...)
```

**Arguments**

|         |                                   |
|---------|-----------------------------------|
| $y$     | output of <code>rtrunc</code>     |
| $\dots$ | other arguments passed to methods |

**Value**

A vector of parameter estimates for the input sample

**Examples**

```
# Normal distribution
sampNorm <- rtrunc(50, mean = 5, sd = 2)
empiricalParameters(sampNorm)

# Poisson distribution
sampPois <- rtrunc(10, lambda = 100, family = "Poisson")
empiricalParameters(sampPois)
```

---

```
empiricalParameters.numeric
```

*Extract parameters*

---

### Description

Extract parameters

### Usage

```
## S3 method for class 'numeric'
empiricalParameters(y, family = "gaussian", natural = FALSE, ...)
```

### Arguments

|         |                                                               |
|---------|---------------------------------------------------------------|
| y       | Numeric vector containing observations from a random variable |
| family  | Distribution family to assume for y                           |
| natural | Should output be in terms of the natural parameter eta?       |
| ...     | arguments passed to <a href="#">empiricalParameters()</a>     |

### Examples

```
# Some random data
x <- c(
  4, 3, 6, 3, 3, 3, 3, 4, 3, 2, 3, 0, 4, 2, 0, 1, 4, 3, 0, 0, 2, 3, 0, 3, 7,
  2, 1, 1, 2, 3, 2, 3, 3, 3, 2, 2, 2, 0, 2, 0, 2, 1, 0, 2, 3, 1, 0, 4, 2, 2,
  0, 1, 1, 1, 2, 2, 3, 1, 3, 1, 1, 0, 3, 3, 2, 0, 2, 2, 3, 0, 2, 1, 0, 0, 1,
  0, 2, 4, 2, 3, 3, 0, 1, 0, 5, 2, 4, 2, 7, 4, 4, 1, 2, 4, 3, 2, 4, 3, 1, 3
)

# Extracting parameters under different distribution assumptions
empiricalParameters(x, family = "normal")
empiricalParameters(x, family = "normal", natural = TRUE)
empiricalParameters(x, family = "binomial", nsize = max(x))
empiricalParameters(x, family = "poisson", natural = FALSE)
empiricalParameters(x, family = "poisson", natural = TRUE)
```

---

```
genrtruncClass
```

*Generates an rtrunc-dispatchable class*

---

### Description

Matches a list of arguments to an rtrunc method

### Usage

```
genrtruncClass(n, family, parms)
```

**Arguments**

|        |                                                                 |
|--------|-----------------------------------------------------------------|
| n      | sample size                                                     |
| family | distribution family                                             |
| parms  | list of parameters passed to rtrunc (through the . . . element) |

**Value**

A character string.

**Author(s)**

Waldir Leoncio

---

mlEstimationTruncDist *ML Estimation of Distribution Parameters*

---

**Description**

ML-estimation of the parameters of the distribution of the specified family, truncated at y.min and y.max

**Usage**

```
mlEstimationTruncDist(
  y,
  y.min = attr(y, "truncation_limits")$a,
  y.max = attr(y, "truncation_limits")$b,
  tol = 1e-05,
  max.it = 100,
  delta = 0.33,
  print.iter = 0,
  ny = 100,
  family = NULL,
  ...
)
```

**Arguments**

|        |                                                                                               |
|--------|-----------------------------------------------------------------------------------------------|
| y      | Sequence spanning the domain of the truncated distribution                                    |
| y.min  | Lower bound for y                                                                             |
| y.max  | Upper bound for y                                                                             |
| tol    | Error tolerance for parameter estimation                                                      |
| max.it | Maximum number of iterations                                                                  |
| delta  | Indirectly, the difference between consecutive iterations to compare with the error tolerance |

|                         |                                                                                                                  |
|-------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>print.iter</code> | Determines the frequency of printing (i.e., prints every <code>print.iter</code> iterations)                     |
| <code>ny</code>         | size of intermediate <code>y</code> range sequence. Higher values yield better estimations but slower iterations |
| <code>family</code>     | distribution family to use                                                                                       |
| <code>...</code>        | other parameters passed to subfunctions                                                                          |

### Details

If `print.iter = TRUE`, the function prints the iteration, the sum of squares of `delta.eta.j` (`delta.L2`), and the current parameter estimates. The `delta` argument of this function is a factor in the calculation of `delta.eta.j`, which in turn is a factor in the calculation of `delta.L2`.

### Value

A vector of class `trunc_*` containing the maximum-likelihood estimation of the underlying distribution \* parameters.

### Author(s)

René Holst

### References

Inspired by Salvador: Pueyo: "Algorithm for the maximum likelihood estimation of the parameters of the truncated normal and lognormal distributions"

### Examples

```
sample_size <- 1000
# Normal
sample.norm <- rtrunc(n = sample_size, mean = 2, sd = 1.5, a = -1)
mlEstimationTruncDist(
  sample.norm,
  y.min = -1, max.it = 500, delta = 0.33,
  print.iter = TRUE
)

# Log-Normal
sample.lognorm <- rtrunc(
  n = sample_size, family = "lognormal", meanlog = 2.5, sdlog = 0.5, a = 7
)
ml_lognormal <- mlEstimationTruncDist(
  sample.lognorm,
  y.min = 7, max.it = 500, tol = 1e-10, delta = 0.3,
  print.iter = FALSE
)
ml_lognormal

# Poisson
sample.pois <- rtrunc(
  n = sample_size, lambda = 10, a = 4, family = "Poisson"
```

```
)
mlEstimationTruncDist(
  sample.pois,
  y.min = 4, max.it = 500, delta = 0.33,
  print.iter = 5
)

# Gamma
sample.gamma <- rtrunc(
  n = sample_size, shape = 6, rate = 2, a = 2, family = "Gamma"
)
mlEstimationTruncDist(
  sample.gamma,
  y.min = 2, max.it = 1500, delta = 0.3,
  print.iter = 10
)

# Negative binomial
sample.nbinom <- rtruncnbinom(
  sample_size, size = 50, prob = .3, a = 100, b = 120
)
mlEstimationTruncDist(sample.nbinom, r=10)
```

## Description

Convert natural parameters to distribution parameters

## Usage

```
natural2parameters(eta, ...)
```

## Arguments

|     |                                   |
|-----|-----------------------------------|
| eta | vector of natural parameters      |
| ... | other arguments passed to methods |

## Value

A vector of the original distribution parameters

## See Also

[parameters2natural\(\)](#)

## Examples

```
samp <- rtrunc(n = 100, lambda = 2, family = "Poisson")
lambda_hat <- empiricalParameters(samp)
eta_hat <- parameters2natural(lambda_hat)
natural2parameters(eta_hat) # yields back lambda
```

|                    |                                                              |
|--------------------|--------------------------------------------------------------|
| parameters2natural | <i>Convert distribution parameters to natural parameters</i> |
|--------------------|--------------------------------------------------------------|

---

## Description

Convert distribution parameters to natural parameters

## Usage

```
parameters2natural(parms, ...)
```

## Arguments

|       |                                                       |
|-------|-------------------------------------------------------|
| parms | A vector of parameters in a distribution distribution |
| ...   | other arguments passed to methods                     |

## Value

A vector containing the natural parameters

## See Also

[natural2parameters\(\)](#)

## Examples

```
# Poisson distribution
samp <- rtrunc(n = 100, lambda = 2, family = "Poisson")
parameters2natural(empiricalParameters(samp))
```

---

|             |                                                 |
|-------------|-------------------------------------------------|
| print.trunc | <i>Print sample from truncated distribution</i> |
|-------------|-------------------------------------------------|

---

**Description**

Special printing methods for trunc\_\* classes.

**Usage**

```
## S3 method for class 'trunc'
print(x, details = FALSE, ...)
```

**Arguments**

|         |                                                                 |
|---------|-----------------------------------------------------------------|
| x       | object to print                                                 |
| details | if FALSE (default), hides the attributes of x                   |
| ...     | other arguments passed to <a href="#">base::print.default()</a> |

**Value**

x with or without its attributes

**Author(s)**

Waldir Leoncio

---

|                |                                       |
|----------------|---------------------------------------|
| probdist-class | <i>Probability distribution class</i> |
|----------------|---------------------------------------|

---

**Description**

An R object describing the properties of a probability distribution.

**Value**

An RC class containing statistical properties of that distribution, namely its name, parameter names and values and natural parameter names and values.

**Author(s)**

Waldir Leoncio

**Examples**

```
probdist(shape = 2, scale = .25, family = "gamma")
probdist(mean = 2, sd = 10, family = "normal")
probdist(eta1 = 2, eta2 = -1, family = "normal")
```

---

ptrunc

*Cumulative Distribution Function*

---

### Description

Calculates the cumulative probability for a given truncated distribution

### Usage

```
ptrunc(q, family, ..., lower.tail = TRUE, log.p = FALSE)
```

```
ptruncnorm(  
  q,  
  mean = 0,  
  sd = 1,  
  a = -Inf,  
  b = Inf,  
  ...,  
  lower.tail = TRUE,  
  log.p = FALSE  
)
```

```
ptruncbeta(  
  q,  
  shape1,  
  shape2,  
  a = 0,  
  b = 1,  
  ...,  
  lower.tail = TRUE,  
  log.p = FALSE  
)
```

```
ptruncbinom(  
  q,  
  size,  
  prob,  
  a = 0,  
  b = size,  
  ...,  
  lower.tail = TRUE,  
  log.p = FALSE  
)
```

```
ptruncpois(q, lambda, a = 0, b = Inf, ..., lower.tail = TRUE, log.p = FALSE)
```

```
ptruncchisq(q, df, a = 0, b = Inf, ..., lower.tail = TRUE, log.p = FALSE)
```

```
ptrunccontbern(q, lambda, a = 0, b = 1, ...)

ptruncexp(q, rate = 1, a = 0, b = Inf, ..., lower.tail = TRUE, log.p = FALSE)

ptruncgamma(
  q,
  shape,
  rate = 1,
  scale = 1/rate,
  a = 0,
  b = Inf,
  ...,
  lower.tail = TRUE,
  log.p = FALSE
)

ptruncinvgamma(
  q,
  shape,
  rate = 1,
  scale = 1/rate,
  a = 0,
  b = Inf,
  ...,
  lower.tail = TRUE,
  log.p = FALSE
)

ptruncinvgauss(q, m, s, a = 0, b = Inf, ...)

ptrunclnorm(
  q,
  meanlog = 0,
  sdlog = 1,
  a = 0,
  b = Inf,
  ...,
  lower.tail = TRUE,
  log.p = FALSE
)

ptruncnbinom(
  q,
  size,
  prob,
  mu,
  a = 0,
```

```

    b = Inf,
    ...,
    lower.tail = TRUE,
    log.p = FALSE
  )

```

### Arguments

|            |                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| q          | vector of quantiles                                                                                                                                                     |
| family     | distribution family to use                                                                                                                                              |
| ...        | <i>named</i> distribution parameters and/or truncation limits (a, b)                                                                                                    |
| lower.tail | logical; if TRUE, probabilities are $P(X \leq x)$ otherwise, $P(X > x)$                                                                                                 |
| log.p      | logical; if TRUE, probabilities p are given as $\log(p)$                                                                                                                |
| mean       | mean of parent distribution                                                                                                                                             |
| sd         | standard deviation of parent distribution                                                                                                                               |
| a          | point of left truncation. For discrete distributions, a will be included in the support of the truncated distribution.                                                  |
| b          | point of right truncation                                                                                                                                               |
| shape1     | positive shape parameter alpha                                                                                                                                          |
| shape2     | positive shape parameter beta                                                                                                                                           |
| size       | target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer. |
| prob       | probability of success on each trial                                                                                                                                    |
| lambda     | mean and var of "parent" distribution                                                                                                                                   |
| df         | degrees of freedom for "parent" distribution                                                                                                                            |
| rate       | inverse gamma rate parameter                                                                                                                                            |
| shape      | inverse gamma shape parameter                                                                                                                                           |
| scale      | inverse gamma scale parameter                                                                                                                                           |
| m          | vector of means                                                                                                                                                         |
| s          | vector of dispersion parameters                                                                                                                                         |
| meanlog    | mean of untruncated distribution                                                                                                                                        |
| sdlog      | standard deviation of untruncated distribution                                                                                                                          |
| mu         | alternative parametrization via mean                                                                                                                                    |

### Value

The cumulative probability of y.

### Examples

```

ptrunc(0)
ptrunc(6, family = "gaussian", mean = 5, sd = 10, b = 7)
pnorm(6, mean = 5, sd = 10) # for comparison

```

---

| a          | point of left truncation. For discrete distributions, a will be included in the support of the truncated distribution.                                                  |
| b          | point of right truncation                                                                                                                                               |
| size       | target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer. |
| prob       | probability of success on each trial                                                                                                                                    |
| df         | degrees of freedom for "parent" distribution                                                                                                                            |
| lambda     | mean and var of "parent" distribution                                                                                                                                   |
| rate       | inverse gamma rate parameter                                                                                                                                            |
| shape      | inverse gamma shape parameter                                                                                                                                           |
| scale      | inverse gamma scale parameter                                                                                                                                           |
| m          | vector of means                                                                                                                                                         |
| s          | vector of dispersion parameters                                                                                                                                         |
| meanlog    | mean of untruncated distribution                                                                                                                                        |
| sdlog      | standard deviation of untruncated distribution                                                                                                                          |
| mu         | alternative parametrization via mean                                                                                                                                    |
| mean       | mean of parent distribution                                                                                                                                             |
| sd         | standard deviation is parent distribution                                                                                                                               |

### Value

The quantile of p.

### Examples

```

qtrunc(0.75)
qtrunc(.2, family = "gaussian", mean = 5, sd = 10, b = 7)
qnorm(.2, mean = 5, sd = 10) # for comparison

```

rtruncbeta

*The Truncated Exponential Family***Description**

Random generation for the truncated exponential family distributions. Please refer to the "Details" and "Examples" section for more information on how to use this function.

**Usage**

```

rtruncbeta(n, shape1, shape2, a = 0, b = 1, faster = FALSE)

rtruncbinom(n, size, prob, a = 0, b = size, faster = FALSE)

rtruncchisq(n, df, a = 0, b = Inf, faster = FALSE)

rtrunccontbern(n, lambda, a = 0, b = 1, faster = FALSE)

rtruncexp(n, rate = 1, a = 0, b = Inf, faster = FALSE)

rtruncgamma(n, shape, rate = 1, scale = 1/rate, a = 0, b = Inf, faster = FALSE)

rtruncinvgamma(
  n,
  shape,
  rate = 1,
  scale = 1/rate,
  a = 0,
  b = Inf,
  faster = FALSE
)

rtruncinvgauss(n, m, s, a = 0, b = Inf, faster = FALSE)

rtrunclnorm(n, meanlog, sdlog, a = 0, b = Inf, faster = FALSE)

rtruncnbinom(n, size, prob, mu, a = 0, b = Inf, faster = FALSE)

rtruncnorm(n, mean, sd, a = -Inf, b = Inf, faster = FALSE)

rtruncpois(n, lambda, a = 0, b = Inf, faster = FALSE)

rtrunc(n, family = "gaussian", faster = FALSE, ...)

rtrunc_direct(n, family = "gaussian", parms, a, b, ...)

```

**Arguments**

|         |                                                                                                                                                                         |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n       | sample size                                                                                                                                                             |
| shape1  | positive shape parameter alpha                                                                                                                                          |
| shape2  | positive shape parameter beta                                                                                                                                           |
| a       | point of left truncation. For discrete distributions, a will be included in the support of the truncated distribution.                                                  |
| b       | point of right truncation                                                                                                                                               |
| faster  | if TRUE, samples directly from the truncated distribution (more info in details)                                                                                        |
| size    | target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer. |
| prob    | probability of success on each trial                                                                                                                                    |
| df      | degrees of freedom for "parent" distribution                                                                                                                            |
| lambda  | mean and var of "parent" distribution                                                                                                                                   |
| rate    | inverse gamma rate parameter                                                                                                                                            |
| shape   | inverse gamma shape parameter                                                                                                                                           |
| scale   | inverse gamma scale parameter                                                                                                                                           |
| m       | vector of means                                                                                                                                                         |
| s       | vector of dispersion parameters                                                                                                                                         |
| meanlog | mean of untruncated distribution                                                                                                                                        |
| sdlog   | standard deviation of untruncated distribution                                                                                                                          |
| mu      | alternative parametrization via mean                                                                                                                                    |
| mean    | mean of parent distribution                                                                                                                                             |
| sd      | standard deviation is parent distribution                                                                                                                               |
| family  | distribution family to use                                                                                                                                              |
| ...     | individual arguments to each distribution                                                                                                                               |
| parms   | list of parameters passed to rtrunc (through the ... element)                                                                                                           |

**Details**

One way to use this function is by calling the `rtrunc` generic with the `family` parameter of your choice. You can also specifically call one of the methods (e.g. `rtruncpois(10, lambda=3)` instead of `rtrunc(10, family="poisson", lambda=3)`). The latter is more flexible (i.e., easily programmable) and package.

Setting `faster=TRUE` uses a new algorithm that samples directly from the truncated distribution, as opposed to the old algorithm that samples from the untruncated distribution and then truncates the result. The advantage of the new algorithm is that it is way faster than the old one, particularly for highly-truncated distributions. On the other hand, the sample for untruncated distributions called through `rtrunc()` will no longer match their [stats](#)-package counterparts for the same seed.

**Value**

A sample of size  $n$  drawn from a truncated distribution  
vector of one of the `rtrunc_*` classes containing the sample elements, as well as some attributes related to the chosen distribution.

**Note**

The current sample-generating algorithm may be slow if the distribution is largely represented by low-probability values. This will be fixed soon. Please follow <https://github.com/ocbe-uio/TruncExpFam/issues/72> for details.

**Examples**

```
# Truncated binomial distribution
sample.binom <- rtrunc(
  100, family = "binomial", prob = 0.6, size = 20, a = 4, b = 10
)
sample.binom
plot(
  table(sample.binom), ylab = "Frequency", main = "Freq. of sampled values"
)

# Truncated Log-Normal distribution
sample.lognorm <- rtrunc(
  n = 100, family = "lognormal", meanlog = 2.5, sdlog = 0.5, a = 7
)
summary(sample.lognorm)

hist(
  sample.lognorm,
  nclass = 35, xlim = c(0, 60), freq = FALSE,
  ylim = c(0, 0.15)
)

# Normal distribution
sample.norm <- rtrunc(n = 100, mean = 2, sd = 1.5, a = -1)
head(sample.norm)
hist(sample.norm, nclass = 25)

# Gamma distribution
sample.gamma <- rtrunc(n = 100, family = "gamma", shape = 6, rate = 2, a = 2)
hist(sample.gamma, nclass = 15)

# Poisson distribution
sample.pois <- rtrunc(n = 10, family = "poisson", lambda = 10, a = 4)
sample.pois
plot(table(sample.pois))
```

|-------------|-------------------------------------|
| TruncExpFam | <i>Truncated Exponential Family</i> |
|-------------|-------------------------------------|

---

## Description

TruncExpFam is an R package to handle truncated members from the exponential family.

## Details

This package offers truncated counterparts of the density-, distribution-, quantile- and sampling-functions for a broad range of distributions from the exponential family, as implemented in the [stats](#) package.

The package also provides functions for estimating the parameters of the distributions from data, given the truncation limits.

For more info, please check [rtrunc\(\)](#), [dtrunc\(\)](#) and [print.trunc\(\)](#). Counterparts for density and probability functions are on the roadmap for a future release.

## Supported distributions

- Beta
- Binomial
- Chi-Square
- Continuous Bernoulli
- Exponential
- Gamma
- Inverse Gamma
- Inverse Gaussian
- Log-normal
- Negative Binomial
- Normal
- Poisson

|---------------------|-----------------------------------|
| validateFamilyParms | <i>Validate family parameters</i> |
|---------------------|-----------------------------------|

---

**Description**

Checks if a combination of distribution family and parameters is valid.

**Usage**

```
validateFamilyParms(family, parms)
```

**Arguments**

|        |                                                    |
|--------|----------------------------------------------------|
| family | character with family distribution name            |
| parms  | character vector with distribution parameter names |

**Value**

list telling if family-parm combo is valid + the family name
